### Introduction

- NbE is a principled approach to full normalization
- and to deciding  $\beta\eta$ -equality.
- Previous work with Klaus Aehlig, Thierry Coquand, Peter Dybjer: NbE for predicative dependent type theories.
- Goal: tackle impredicativity.
- Altenkirch, Hofmann, and Streicher described NbE for System F using heavy category-theoretic machinery.
- This work: conventional, set-theoretic development.

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

2 Weak beta-eta-Normalization

3 Normalization by Evaluation

### Church-Style System F

Terms and Typing

$$\overline{\Gamma \vdash x : \Gamma(x)}$$

 $\frac{\Gamma, x: A \vdash t: B}{\Gamma \vdash \lambda x: A, t: A \rightarrow B} \qquad \frac{\Gamma \vdash r: A \rightarrow B \qquad \Gamma \vdash s: A}{\Gamma \vdash rs: B}$ 

 $\frac{\Gamma \vdash t : A}{\Gamma \vdash \Lambda Xt : \forall XA} X \notin \mathsf{FV}(\Gamma) \qquad \frac{\Gamma \vdash t : \forall XA}{\Gamma \vdash t B : A[B/X]}$ 

• We write  $\Gamma' \leq \Gamma$  if  $\Gamma'$  extends  $\Gamma$ . E.g.,  $\Gamma, x : A \leq \Gamma$ .

# Equational Theory of System F

• Untyped equality is induced by the rewrite rules:

$$\begin{array}{lll} (\lambda x : A. t) s & \longrightarrow_{\beta\eta} & t[s/x] \\ \lambda x : A. t x & \longrightarrow_{\beta\eta} & t & \text{if } x \notin \mathsf{FV}(t) \\ (\Lambda Xt) A & \longrightarrow_{\beta\eta} & t[A/X] \\ \Lambda X. t X & \longrightarrow_{\beta\eta} & t & \text{if } X \notin \mathsf{FV}(t) \end{array}$$

## Long normal forms

• Two mutual judgements:

 $\begin{array}{ll} \Gamma \vdash t \Uparrow A & t \text{ is a long normal form of type } A \\ \Gamma \vdash t \Downarrow A & t \text{ is a neutral long normal form of type } A \end{array}$ 

#### Rules:

 $\frac{\Gamma \vdash r \Downarrow A \to B \quad \Gamma \vdash s \Uparrow A}{\Gamma \vdash r s \Downarrow B} \quad \frac{\Gamma \vdash r \Downarrow \forall XA}{\Gamma \vdash rB \Downarrow A[B/X]}$  $\frac{\Gamma \vdash r \Downarrow X}{\Gamma \vdash rA X} \quad \frac{\Gamma, x : A \vdash t \Uparrow B}{\Gamma \vdash \lambda x : A : t \Uparrow A \to B} \quad \frac{\Gamma \vdash t \Uparrow A}{\Gamma \vdash \Lambda Xt \Uparrow \forall XA} X \notin \mathsf{FV}(\Gamma)$ 

イロト 不得 トイヨト イヨト ヨー ろくの

#### Kripke relations

- Consider a set D with application  $\_\cdot\_: D \times (D \cup Ty) \rightarrow D$ .
- Consider another such applicative structure D'.
- We interpret types as relations  $\mathcal{A} \subseteq Cxt \times D \times D'$ .
- We write  $\Gamma \vdash d \sim d' \in \mathcal{A}$  for  $(\Gamma, d, d') \in \mathcal{A}$ .
- $\mathcal{A}$  is *Kripke* if  $\Gamma' \leq \Gamma \vdash d \sim d' \in \mathcal{A}$  implies  $\Gamma \vdash d \sim d' \in \mathcal{A}$ .
- $\mathcal{A}$  is a *Kripke PER* if  $\Gamma \vdash \_ \sim \_ \in \mathcal{A}$  is symmetric and transitive.

< 口 > < 同 > < 回 > < 回 > < 回 > <

## A specific Kripke PER

Let D = D' = Tm/=<sub>βη</sub>. Let *r* denote the βη-equivalence class of *r*.
For each type *A*, define two Kripke PERs A ⊂ *A*.

 $\Gamma \vdash d \sim d' \in \overline{A} \iff \text{ exists } r \text{ with } d = d' = \overline{r} \text{ and } \Gamma \vdash r \Uparrow A,$  $\Gamma \vdash d \sim d' \in \underline{A} \iff \text{ exists } r \text{ with } d = d' = \overline{r} \text{ and } \Gamma \vdash r \Downarrow A.$ 

- We have weak  $\beta\eta$ -normalization if  $\Gamma \vdash t : A$  implies  $\Gamma \vdash \overline{t} \sim \overline{t} \in \overline{A}$ .
- Proof outline: Define type interpretation <u>A</u> ⊆ [[A]] ⊆ A and prove the fundamental theorem Γ ⊢ [[t]] ~ [[t]] ∈ [[A]].

### Interpretation space

• Constructions on Kripke relations:

 $\begin{array}{lll} \mathcal{A} \to \mathcal{B} &=& \{(\Gamma, f, f') \mid \text{ for all } d, d', \Gamma' \leq \Gamma, \Gamma' \vdash d \sim d' \in \mathcal{A} \\ & \text{ holds } \Gamma' \vdash f \cdot d \sim f' \cdot d' \in \mathcal{B} \} \\ \end{array} \\ \mathcal{A}.\mathcal{B} &=& \{(\Gamma, d, d') \mid \Gamma \vdash d \cdot A \sim d' \cdot A \in \mathcal{B} \} \end{array}$ 

• <u>A</u>, <del>A</del> form an *interpretation space* fulfilling the conditions

| $\underline{A \rightarrow B}$    | $\subseteq$ | $\overline{A} \rightarrow \underline{B}$      |               |
|----------------------------------|-------------|---|---------------|
| $\underline{A} \to \overline{B}$ | $\subseteq$ | $\overline{A \to B}$                          |               |
| <u>∀YA</u>                       | $\subseteq$ | <i>B</i> . <u><i>A</i>[<i>B</i>/<i>Y</i>]</u> | for any B     |
| $X.\overline{A[X/Y]}$            | $\subseteq$ | ∀YA   | for a new $X$ |

• We write  $A \Vdash A$  (pronounced A realizes A) if  $\underline{A} \subseteq A \subseteq \overline{A}$ .

# Type interpretation

• We interpret quantification by an intersection which is indexed only by the *realizable* semantic types.

$$\begin{split} \llbracket X \rrbracket_{\rho} &= \rho(X) \\ \llbracket A \to B \rrbracket_{\rho} &= \llbracket A \rrbracket_{\rho} \to \llbracket B \rrbracket_{\rho} \\ \llbracket \forall XA \rrbracket_{\rho} &= \bigcap_{B \vdash \mathcal{B}} B \cdot \llbracket A \rrbracket_{\rho [X \mapsto \mathcal{B}]} \end{split}$$

- Types realize their interpretation: If  $\sigma(X) \Vdash \rho(X)$  for all X, then  $A\sigma \Vdash \llbracket A \rrbracket_{\rho}$ .
- Proof: Induction on *A*, using the closure conditions of the interpretation space.

#### Syntactical combinatory algebras

• We assume an evaluation function  $(-)_{\eta} \in Tm \rightarrow D$ , satisfying

$$\begin{array}{rcl} (|x|)_{\eta} &=& \eta(x) \\ (|r|s|)_{\eta} &=& (|r|)_{\eta} \cdot (|s|)_{\eta} \\ (|r|A|)_{\eta} &=& (|r|)_{\eta} \cdot A\eta \\ (|\lambda x : A. t|)_{\eta} \cdot d &=& (|t|)_{\eta[x \mapsto d]} \\ (|\lambda Xt|)_{\eta} \cdot A &=& (|t|)_{\eta[x \mapsto d]} \\ (|t[s/x]])_{\eta} &=& (|t|)_{\eta[x \mapsto (|s|)_{\eta}]} \\ (|t[A/x]])_{\eta} &=& (|t|)_{\eta[x \mapsto A\eta]} \\ (|t|)_{\eta} &=& (|t|)_{\eta'} & \text{if } \eta(x) = \eta'(x) \text{ for all } x \in \mathsf{FV}(t) \end{array}$$

• The last three equations do not hold for all applicative structures, e.g., not for explicit substitution calculi with trivial equality.

Andreas Abel (LMU Munich)

## Fundamental theorem

#### Theorem (Validity of typing)

Let  $\eta \Vdash \rho$  and both  $\eta \upharpoonright \mathsf{TyVar} = \eta' \upharpoonright \mathsf{TyVar}$  and  $\Delta \vdash \eta \sim \eta' \in \llbracket \Gamma \rrbracket_{\rho}$ . If  $\Gamma \vdash t : A$  then  $\Delta \vdash (t)_{\eta} \sim (t)_{\eta'} \in \llbracket A \rrbracket_{\rho}$ .

Corollary (Weak  $\beta\eta$ -normalization of System F) If  $\Gamma \vdash t$ : A then t  $\beta$ -reduces  $\eta$ -expands to a long normal form t'.

#### Proof.

Clearly,  $A \Vdash \llbracket A \rrbracket$ . By the theorem,  $\Gamma \vdash (t) \sim (t) \in \llbracket A \rrbracket$ , meaning  $t =_{\beta\eta} t'$  with  $\Gamma \vdash t' \Uparrow A$ . We conclude by Church-Rosser for  $\beta$ -reduction  $\eta$ -expansion.

### NbE for System F

• The typed equational theory of System F is induced by

$$\frac{\Gamma, x : A \vdash t : B \qquad \Gamma \vdash s : A}{\Gamma \vdash (\lambda x : A, t) s = t[s/x] : B}$$

$$\frac{\Gamma \vdash t : A \rightarrow B}{\Gamma \vdash \lambda x : A, t x = t : A \rightarrow B} x \notin FV(t)$$

$$\frac{\Gamma \vdash t : A \qquad X \notin FV(\Gamma)}{\Gamma \vdash (\Lambda Xt) B = t[B/X] : A[B/X]}$$

$$\frac{\Gamma \vdash t : \forall XA}{\Gamma \vdash \Lambda X, t X = t : \forall XA} X \notin FV(t)$$

Task: find function nf(Γ⊢t:A) which is
complete, i. e., Γ⊢t = t' : A implies nf(Γ⊢t:A) ≡ nf(Γ⊢t':A), and
sound, i. e., if Γ⊢t : A then Γ⊢t =<sub>βη</sub> nf(Γ⊢t:A) : A.

#### **Evaluation**

• As combinatory algebra, use Scott domain

 $\mathsf{D} = (\mathsf{Var} \times (\mathsf{D} \cup \mathsf{Ty})^{<\omega}) \oplus [\mathsf{D} \to \mathsf{D}] \oplus (\mathsf{Ty} \to \mathsf{D}).$ 

#### Three types of values:

- 1 neutral objects e ::= x | e d | e A.
- 2 continuous functions  $f \in [D \rightarrow D]$
- **3** functions  $F \in Ty \rightarrow D$  from types to values
- Application of values defined obviously.
- Evaluation of abstractions is defined by

#### Contextual reification

• We can read back values as terms; this is called reification.

$$\label{eq:relation} \begin{split} \Gamma &\vdash d \searrow t \Uparrow A \qquad d \text{ reifies to } t \text{ at type } A, \\ \Gamma &\vdash d \searrow t \Downarrow A \qquad d \text{ reifies to } t, \text{ inferring type } A. \end{split}$$

Rules:

$$\frac{\Gamma \vdash e \searrow r \Downarrow A \to B \qquad \Gamma \vdash d \searrow s \Uparrow A}{\Gamma \vdash e d \searrow r s \Downarrow B}$$

$$\frac{\Gamma \vdash e \bigotimes r \Downarrow \forall XA}{\Gamma \vdash e B \searrow r B \Downarrow A[B/X]} \qquad \frac{\Gamma \vdash e \searrow r \Downarrow X}{\Gamma \vdash e \searrow r \Uparrow X}$$

$$\frac{\Gamma, x : A \vdash f \cdot x \searrow t \Uparrow B}{\Gamma \vdash f \searrow \lambda x : A \cdot t \Uparrow A \to B} \qquad \frac{\Gamma \vdash F \cdot X \searrow t \Uparrow A}{\Gamma \vdash F \searrow \Lambda X t \Uparrow \forall XA}$$

## Completeness of NbE

- nf(Γ ⊢ t: A) returns the reification of the evaluation of t, i. e., the t' such that Γ ⊢ (t) \sqrt{t' ↑ A.
- Let an interpretation space be defined by

 $\begin{array}{ll} \Gamma \vdash d \sim d' \in \overline{A} & \Longleftrightarrow & \text{exists } t \text{ with } \Gamma \vdash d, d' \searrow t \Uparrow A, \\ \Gamma \vdash d \sim d' \in \underline{A} & \Longleftrightarrow & \text{exists } t \text{ with } \Gamma \vdash d, d' \searrow t \Downarrow A. \end{array}$ 

Theorem (Completeness of NbE)

If  $\Gamma \vdash t = t' : A$  then  $\Gamma \vdash (t) \searrow r \uparrow A$  and  $\Gamma \vdash (t') \searrow r \uparrow A$  for some long normal form r.

## Soundness of NbE

Soundness wrt. untyped equality is obtained via setting

 $\begin{array}{ll} \Gamma \vdash d \sim \overline{t} \in \overline{A} & \Longleftrightarrow & \text{exists } t' \text{ with } \Gamma \vdash d \searrow t' \Uparrow A \text{ and } t =_{\beta\eta} t', \\ \Gamma \vdash d \sim \overline{t} \in \underline{A} & \Longleftrightarrow & \text{exists } t' \text{ with } \Gamma \vdash d \searrow t' \Downarrow A \text{ and } t =_{\beta\eta} t'. \end{array}$ 

- The fundamental theorem implies: If  $\Gamma \vdash t : A$  then  $\Gamma \vdash (|t|)_{\eta_{id}} \searrow t' \Uparrow A$  and  $t =_{\beta \eta} t'$ .
- What about soundness wrt. judgmental equality?
- Welltyped terms modulo judgmental equality are not a combinatory algebra D.
- Hence, we need a new version of the fundamental theorem.

イロト 不得 トイヨト イヨト ヨー ろくの

### Kripke logical relations

- Kripke logical relations between syntax and semantics S ⊆ Cxt × Tm × Ty × D satisfy for all (Γ, t, A, d) ∈ S:
  Γ ⊢ t : A,
  Γ' ≤ Γ implies (Γ', t, A, d) ∈ S, and
  Γ ⊢ t = t' : A implies (Γ, t', A, d) ∈ S.
- Redo the whole development: semantic function space, interpretation space, realizability, semantic quantification, fundamental theorem.

#### Conclusions

- NbE for System F with conventional means.
- Follows the structure of a weak normalization proof.
- Further work:
  - Find an abstraction of semantics that works for both completeness and soundness of NbE.
  - Scale to  $F^{\omega}$ .
  - Scale to the Calculus of Constructions.
- Acknowledgments: This work was carried out during a visit to Frédéric Blanqui and Cody Roux at LORIA, Nancy, France, financed by the *Bayrisch-Französisches Hochschulzentrum*.
