3 The First Gtk2Hs Program

Introduction to GUI programming

Introduction to GTK+ and Gtk2Hs

- The biggest difference between CUI and GUI is the control mechanism
 - in the console the application is in control of everything

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- in the graphical interface the environment is in control
- The environment notifies the program for all interesting events
- The application responds by executing some actions

- In the console, everything is text which flows from and to the application
- In the graphical interface, every visual element is an **object** which is owned by the application

• The visual elements are nested in each other (i.e. some elements are **containers** for other elements)

Introduction to GUI programming

Introduction to GTK+ and Gtk2Hs

• **GTK** (Gimp ToolKit) is an open-source and cross-platform graphical library:

http://www.gtk.org/

- The core technology behind GNOME
- Written in **C** with architecture that makes it easy to write bindings for other languages.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

• Gtk2Hs is the Haskell binding to GTK+

http://www.haskell.org/gtk2hs/

- Rather low-level library. Every function and type is just exported to Haskell.
- There are high-level abstractions for some concepts i.e.: Attributes, Events, etc.
- We will stick to the low-level API since it has better coverage

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Gtk2Hs Installation

- You need:
 - Gtk2Hs 0.12.2
 - GTK+ 2.22
- On Linux GTK is probably already installed; On Windows you have to install GTK first and Gtk2Hs after that. Read more here:

http://www.cse.chalmers.se/edu/course/TDA451_ Functional_Programming/labs/4/gtk2hs-install.html

• Everything is already installed on the Chalmers machines.

Sources of Inspiration

GTK+ is a huge library. If you don't know how to do something:

- Look at the demos (http://code.haskell.org/gtk2hs/gtk/demo/)
- Search the documentation (http://hackage.haskell.org/package/gtk-0.12.0).
 Note: If you cannot find some function for a given type, then look at the super class.

Ask in the course's Google Group

There is a Gtk2Hs tutorial on the course web page

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Introduction to GUI programming

Introduction to GTK+ and Gtk2Hs

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

3 The First Gtk2Hs Program

A simple graphical interface that:

- opens a window
- lets the user to draw lines
- the width of the lines is configurable

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

• You need to import the library:

import Graphics.UI.Gtk

Note: This is the top-level module which imports several other modules, so you don't need to list them explicitly

Initialize the library:

initGUI :: IO ()

• Run the event loop: mainGUI :: IO () Look at Graphics.UI.Gtk.Windows.Window windowNew :: IO Window

• You also need to show the Window, so since it is a Widget look at: *Graphics.UI.Gtk.Abstract.Widget*

widgetShow :: WidgetClass self \Rightarrow self \rightarrow IO () widgetShowAll :: WidgetClass self \Rightarrow self \rightarrow IO ()

I close the window but the program doesn't terminate, why?

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

• We have to tell GTK when to terminate the event loop: onDestroy :: WidgetClass w \Rightarrow w \rightarrow IO () \rightarrow IO (ConnectId w) mainQuit :: IO () • Look at Graphics.UI.Gtk.Misc.DrawingArea

drawingAreaNew :: IO DrawingArea

• DrawingArea have to be added as a child of Window, look at *Graphics.UI.Gtk.Abstract.Widget*

containerAdd :: (ContainerClass self, WidgetClass widget) \Rightarrow self \rightarrow widget \rightarrow IO ()

- When the user clicks on the window, then the program have to react.
- We need a listener for the 'button press' event:

onButtonPress :: WidgetClass w \Rightarrow w \rightarrow (Event \rightarrow IO Bool) \rightarrow IO (ConnectId w)

(in Graphics.UI.Gtk.Abstract.Widget)

 The default way to model state in GTK is by using the IORef type from the standard Haskell library. In module Data.IORef:

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

```
newIORef :: a \rightarrow IO (IORef a)
readIORef :: IORef a \rightarrow IO a
writeIORef :: IORef a \rightarrow a \rightarrow IO ()
```

- GTK+ has two (and more) layers GTK and GDK
- GTK is the higher level where the user interface is composed of controls

- GDK is the lower level which is closer to the "device"
- The drawing operations are on the device level

• Every GTK widget is associated with one GDK window. The relation is:

 $\mathsf{widgetGetDrawWindow}:: \mathsf{WidgetClass} \ \mathsf{widget} \Rightarrow \mathsf{widget} \to \mathsf{IO} \ \mathsf{DrawWindow}$

• Every drawing session is within some Graphical Context (GC): gcNew :: DrawableClass d \Rightarrow d \rightarrow IO GC

• The graphical context remembers attributes like current color, font, filling pattern, etc.

gcSetValues :: GC \rightarrow GCValues \rightarrow IO ()

 $\mathsf{gcGetValues}::\ \mathsf{GC}\to\mathsf{IO}\ \mathsf{GCValues}$

• They are used by all drawing primitives

drawLines :: DrawableClass d \Rightarrow d \rightarrow GC \rightarrow [Point] \rightarrow IO ()

- The environment tells the program when it have to redraw the window.
- This is yet another event:

```
onExpose :: WidgetClass w \Rightarrow w \rightarrow (Event \rightarrow IO Bool) \rightarrow IO (ConnectId w)
```

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

• When the program have changed its state then it have to tell the environment that it have to refresh its windows.

widgetQueueDraw :: WidgetClass self \Rightarrow self \rightarrow IO ()

• After that the environment activates the 'Expose' event.

- If you want more than one widget in the window then you have to arrange them somehow.
- GTK provides Layout Widgets:

vBoxNew :: Bool \rightarrow Int \rightarrow IO VBox hBoxNew :: Bool \rightarrow Int \rightarrow IO HBox

• We pack widgets into boxes using:

boxPackStart :: (BoxClass self, WidgetClass child) \Rightarrow self \rightarrow child \rightarrow Packing \rightarrow Int \rightarrow

• Entry

entryNew :: IO Entry

Button

buttonNew :: IO Button

buttonNewWithLabel :: String \rightarrow IO Button

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

• We have to tell GTK how big drawing area we want onSizeRequest :: WidgetClass w \Rightarrow w \rightarrow IO Requisition \rightarrow IO (ConnectId w)

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Now we can change the width of the line

• Attach a listener to the button click:

onClicked :: ButtonClass $b \Rightarrow b \rightarrow IO$ () $\rightarrow IO$ (ConnectId b)

- Get the text from the entry box $\label{eq:entryGetText} {\rm entryGetText} :: {\rm EntryClass} \; {\rm self} \Rightarrow {\rm self} \to {\rm IO} \; {\rm String}$
- The text into the entry may not be a number use message boxes! (Graphics.UI.Gtk.Windows.MessageDialog)

• Set the actual width. Remeber the GCValues structure!

Now we have a complete program!

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ
