Introduction to Functional Programming

Course Summary and Future

int getRandomNumber() { return 4; // chosen by fair dice roll. // guaranteed to be random. }

Based on material by Koen Lindström Claessen

The End of the Course

- Next week: Exam
 - Example exams + answers on the web
 - No computers
 - In English: Bring an English dictionary
 - answers may be in swedish
 - A list of standard Haskell functions

What If ...

- You are not done with the labs in time?
 - Next year: This course runs again
 - Reuse labs
 - Possibly other/changed labs

What If ...

- You do not pass the exam?
 - January: Re-exam
 - August: Re-exam
 - Next year: This course runs again

What Have We Learned?

- Programming
 - For some of you: first time
 - Make the computer do some useful tasks
- Programming Language
 - Haskell
 - Different from what most of you had seen before
- Programming *Principles*

Programming Principles (I)

- Modelling
 - Create a new type that models what you are dealing with
 - Design and define typed functions around your types
 - Sometimes your type has an extra invariant
 - Invariants should be **documented** (for example as a property)

Programming Principles (II)

- Properties
 - When you define **functions** around your types...
 - Think about and define properties of these functions
 - Properties can be **tested** automatically to find mistakes
 - Mistakes can be in your functions (program) or in your properties (understanding)

Programming Principles (III)

- Recursion
 - When you need to solve a large, complicated problem...
 - Break the problem up into a smaller piece, or a number of smaller pieces
 - These can be solved **recursively**
 - Solve the whole problem by combining all recursive solutions

Programming Principles (IV)

- Abstraction and Generalization
 - When you find yourself repeating a programming task
 - Take a step back and see if you can generalize
 - You can often define a **abstraction** (higher-order function) performing the old task and the new one
 - Avoid copy-and-paste programming

Programming Principles (V)

- Pure functions
 - Use **pure functions** as much as possible
 - These are easier to understand, specify and test
 - Concentrate IO instructions in a small part of your program
 - Concentrate GUI instructions in a small part of your program

Programming Principles (VI)

- Separation
 - Divide up your program into small units (functions)
 - These should be grouped together into larger units (modules)
 - Minimize dependencies between these parts
 - So that it is easy to make internal changes, without affecting your whole program

Programming Principles

- Important!
- Independent of *programming language*

Report from the front

"Läste kursen 2010 när jag började på D och lärde mig mycket, fast jag tyckte att jag kunde programmera innan. Fick 2012 jobb på Ericsson och programmerade då i Python, och <u>använde då</u> <u>dagligen tekniker som jag lärde mig i kursen,</u> <u>framförallt då rekursion, operationer på listor och</u> <u>delar av det funktionella programmeringssättet</u> som var nytt för mig 2010."

Report from the front

"En vanlig fråga/missuppfattning som jag minns från början av Chalmers är just 'varför Haskell? Ingen använder det på riktigt i industrin', och det kan vara värt att påminna en extra gång om att <u>man lär sig</u> <u>metoder och tankesätt som är användbara oavsett</u> <u>vilket språk man sedan kodar i</u>."

Why Haskell?

- What is easy in Haskell:
 - Defining types
 - Properties and testing
 - Recursion
 - Abstraction, higher-order functions
 - Pure functions
 - Separation (laziness)

Why Haskell (II)?

- What is harder in Haskell:
 - Ignoring types
 - Static strong typing
 - Expressive type system
 - Most advanced type system in a real language
 - Impure functions
 - All functions are pure
 - The only general existing programming language
 - Instructions are created and composed explicitly
 - Makes it clear where the "impure stuff" happens

Functional Programming

- "Drives" development of new programming languages
 - Type systems

. . .

- Garbage collection
- Higher-order functions / Lambdas
- List comprehensions
- Haskell is the most advanced functional programming language today

Functional Programming

- Hot topic in PL community and industry
 - Compilers/compiler-like
 - Domain-specific languages (Haskell)
 - build your own programming language with little effort
 - Telecom industry (Erlang)
 - Dealing with complex protocols/data-flow
 - Need to get right
 - Financial industry (Haskell)
 - Dealing with complex calculations
 - Need to get *right*

Functional Programming

- Writing programs = defining (pure) functions and composing functions
- Running programs = evaluating expressions
- Functions are "first-class", they can be created (lambda expressions) and passed around control (biobox order)
 functional programming language = a language in which this style is easy and encouraged

Imperative Programming

- Writing programs = writing instructions and composing instructions that do things and change things
- Running programs = executing instructions

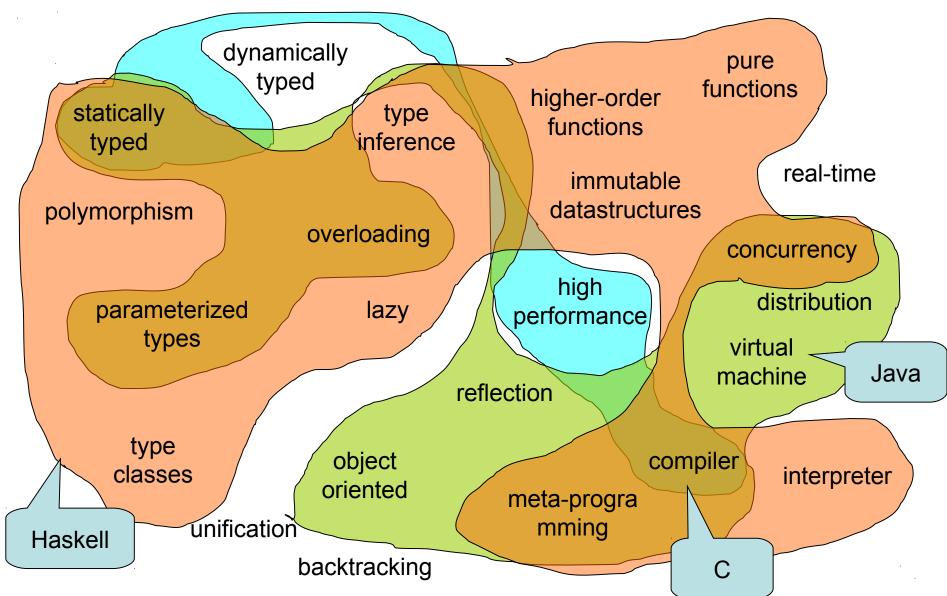

A Wise Man ..

A Good Functional Programmer is a Good Programmer

Programming Languages

Lisp	Scheme		С	BASIC
	Haskell	Java	C++ C#	
	ML	Python		JavaScript
O'CaN	/IL Cur	ry bash	csh Perl	
	Erlang Prolog		Ruby	
VHDL	Lustre	Mercury	PostScrip	ot
	Estere	9	SQL	PDF
	Verilog		UQL	

Programming Language Features

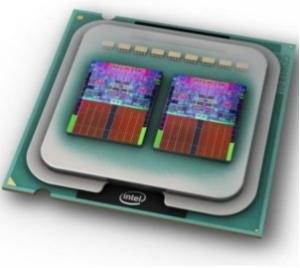

Learning a Programming Language

- Learn the new features, principles, associated with the language
- Reuse things you know from other languages
- Learn *different* languages
 - what is popular now might not be popular in 5 years from now
- Use the right language for the right job
 Systems consist of several languages

Multi-core Revolution

- Traditional ways of programming *do not work* – a **challenge** for the programming language community
- Right now, industry is looking for alternatives
 - Intel
 - Microsoft
 - IBM

Alternatives?

- Expression-level parallelism
 - Haskell
 - Other functional languages
- Software Transactional Memory – Haskell
- Message passing between processes

- Erlang

restriction: no shared memory

restriction:

no side effects

> restriction: control of side effects

This Course

- Introduction to programming
- Introduction to Haskell

• There is lots, lots more...

Coming Programming Courses

D-line

- Object-oriented programming
 - Java
- Embedded systems programming
 - Assembly
 - C

 Two programming courses GU

- Both in Java
- Datastructures
 - Java
 - Haskell

- Data structures
 - Java
 - Haskell

Future Programming Courses

- Concurrent Programming
- Compiler Construction
- Advanced Functional Programming
- Parallel Functional Programming
- Software Engineering using Formal Methods
- Language Technology
- Programming Paradigms

•
