

# Exercise 3

SQL queries  
Relational algebra

A stylized silhouette of a mountain range in a darker teal color, located in the bottom right corner of the slide.

# Example

## Courses

Code	Name	nrStudents
AB123	Math	19
CD234	Physics	24
EF345	Karaoke	23
GH456	PERL	20

◆ SELECT name  
FROM Courses  
WHERE nrStudents > 20

◆  $\pi_{\text{name}}(\sigma_{\text{nrStudents} > 20}(\text{Courses}))$

Physics

Karaoke

The most common question

**What the hell is  
relational algebra  
good for?**

# The DBMS uses relational algebra

- ◆ A DBMS may have many different ways of implementing the relational algebra operations.
- ◆ The aim of query optimization is to choose the most efficient one.
- ◆ To do this, it uses formulae that estimate the costs for a number of options and selects the one with the lowest cost.

# Projection

- ◆ Which attributes
- ◆ Which columns
- ◆ SELECT A,C,E
- ◆  $\pi_{A,C,E}$

A	B	C	D	E	F

# Selection

- ◆ Which tuples
- ◆ Which rows
- ◆ WHERE  $E > 5$
- ◆  $\sigma_{E > 5}$
- ◆ DON'T confuse SELECT (projection) for selection!!

A	B	C	D	E	F
				4	
				7	
				5	
				8	
				3	

# SQL vs. Relational Algebra

SELECT	X	
FROM	T	
WHERE	C	
GROUP BY	Y	$\tau_Z(\pi_X(\sigma_D(\gamma_Y(\sigma_C(T))))))$
HAVING	D	
ORDER BY	Z	

# Combining tables

- ◆ Set (actually bag) operations
- ◆ Cartesian product
- ◆ Joins

# Set (actually bag) operations

R =

A	B
1	2
3	4

S =

A	B
1	2
5	6

A	B
1	2
3	4
1	2
5	6

R UNION ALL S

$R \cup S$

R INTERSECT S

$R \cap S$

R MINUS S

$R - S$

A	B
1	2

A	B
3	4

# Joins

- ◆ 3 "basic" joins:
  - Cartesian product
  - Conditional join
    - ◆ Theta join, Inner join, Equi join, Nonequi join, Natural join
  - Outer join

# Cartesian product

R =

A	B
1	2
3	4

S =

C	D
5	6
7	8

R.A	R.B	S.C	S.D
1	2	5	6
1	2	7	8
3	4	5	6
3	4	7	8

R, S

$R \times S$

# Conditional join = Inner join

R=	<table border="1"><tr><th>A</th><th>B</th></tr><tr><td>1</td><td>2</td></tr><tr><td>3</td><td>4</td></tr></table>	A	B	1	2	3	4	S=	<table border="1"><tr><th>B</th><th>C</th></tr><tr><td>3</td><td>4</td></tr><tr><td>4</td><td>5</td></tr></table>	B	C	3	4	4	5
A	B														
1	2														
3	4														
B	C														
3	4														
4	5														

If C is "R.A = S.B"

R.A	R.B	S.B	S.C
3	4	3	4

R,S

WHERE C

or

R JOIN S ON C

$R \bowtie_C S$

If C is equality –  
Equi join

If C is inequality –  
Nonequi join

Beware of NULL!

# Special case – Natural join

<b>R=</b>	<table border="1"><thead><tr><th><b>A</b></th><th><b>B</b></th></tr></thead><tbody><tr><td>1</td><td>2</td></tr><tr><td>3</td><td>4</td></tr></tbody></table>	<b>A</b>	<b>B</b>	1	2	3	4	<b>S=</b>	<table border="1"><thead><tr><th><b>B</b></th><th><b>C</b></th></tr></thead><tbody><tr><td>4</td><td>5</td></tr><tr><td>6</td><td>7</td></tr></tbody></table>	<b>B</b>	<b>C</b>	4	5	6	7
<b>A</b>	<b>B</b>														
1	2														
3	4														
<b>B</b>	<b>C</b>														
4	5														
6	7														

R NATURAL JOIN S

$R \bowtie S$

<b>R.A</b>	<b>B</b>	<b>S.C</b>
3	4	5

# Outer join

R =

A	B
1	2
3	4

S =

C	D
4	5
6	7

R FULL OUTER JOIN S  
ON R.B = S.C

R.A	R.B	S.C	S.D
1	2	NULL	NULL
3	4	4	5
NULL	NULL	6	7

R FULL/LEFT/RIGHT  
OUTER JOIN S ON C

All rows in both/left/right table(s) will appear, and the rest will be filled with null if C does not match.

# There is more...

Grouping  
Renaming  
Sorting

Also note that the terminology regarding joins is confused.

Inner join = Equi join (orafaq.com)

Inner join = Conditional join (Wikipedia)

Theta join = Conditional join (Course book)
