# Robust Erlang (PFP Lecture 11)

John Hughes

# **Genesis of Erlang**

- **Problem:** telephony systems in the late 1980s
  - Digital
  - More and more complex
  - Highly concurrent
  - Hard to get right

"Plain Old Telephony System"

- Approach: a group at Ericsson research programmed POTS in different languages
- Solution: nicest was *functional* programming—but not concurrent
- Erlang designed in the early 1990s

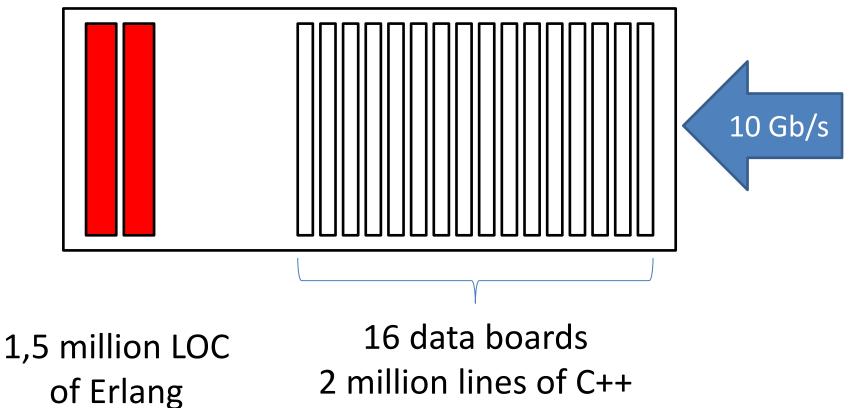

# Mid 1990s: the AXD 301

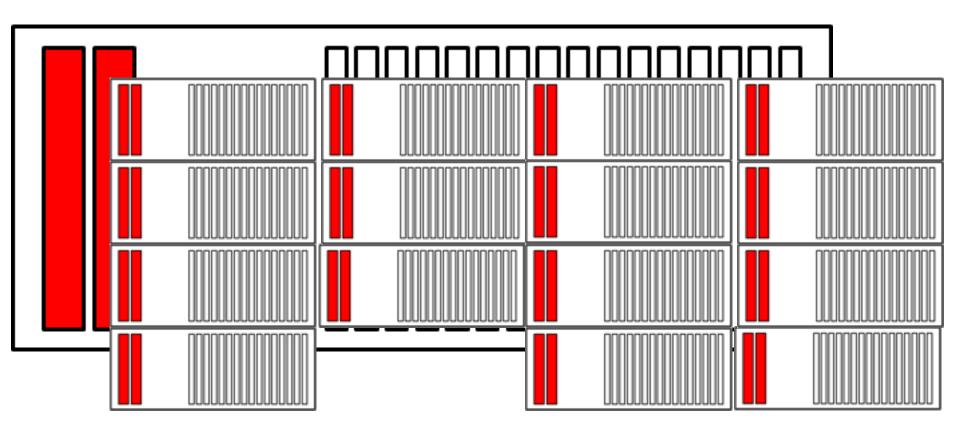

- ATM switch (telephone backbone), released in 1998
- First *big* Erlang project
- Born out of the ashes of a disaster!

# AXD301 Architecture

#### Subrack

- 160 Gbits/sec (240,000 simultaneous calls!)
- 32 distributed Erlang nodes
- Parallelism vital from the word go

# Typical Applications Today

**Facebook Chat** 

# **klarna**

Invoicing services for web shops—in 6 countries!

\*riak

Distributed no-SQL database serving e.g. all Denmark's medicine card data

# What do they all have in common?

Serving *huge* numbers of clients through parallelism

Very high demands on *quality of service:* these systems should work *all* of the time

# AXD 301 Quality of Service

- 7 nines reliability!
  - Up 99,99999% of the time
- Despite
  - Bugs
    - (10 bugs per 1000 lines is *good*)
  - Hardware failures
    - Always something failing in a big cluster
    - Avoid any SPOF

# Example: Area of a Shape

area({square,X}) -> X\*X; area({rectangle,X,Y}) -> X\*Y.

8> test:area({rectangle,3,4}).

12

9> test:area({circle,2}).

\*\* exception error: no function clause matching
test:area({circle,2}) (test.erl, line 16)
10>

What do we do about it?

# **Defensive Programming**

Anticipate a possible error

area({square,X}) -> X\*X; area({rectangle,X,Y}) -> X\*Y; area(\_) -> 0. Return a plausible result.

11> test:area({rectangle,3,4}).
12
12> test:area({circle,2}).
0

# Plausible Scenario

- We write lots more code manipulating shapes
- We add circles as a possible shape
  - But we forget to change area!

#### <LOTS OF TIME PASSES>

- We notice something doesn't work for circles

   We silently substituted the wrong answer
- We write a special case *elsewhere* to "work around" the bug

# Handling Error Cases

- Handling errors often accounts for > <sup>3</sup>/<sub>3</sub> of a system's code
  - Expensive to construct and maintain
  - Likely to contain >  $\frac{2}{3}$  of a system's bugs
- Error handling code is often poorly tested
   Code coverage is usually << 100%</li>
- 2/3 of system crashes are caused by bugs in the error handling code

But what can we do about it?

# Don't Handle Errors!

Stopping a malfunctioning program

...is better than ...

Letting it continue and wreak untold damage

# Let it crash... locally

- **Isolate** a failure within one process!
  - No shared memory between processes
  - No mutable data
  - One process cannot cause another to fail

• One client may experience a failure... but the rest of the system keeps going

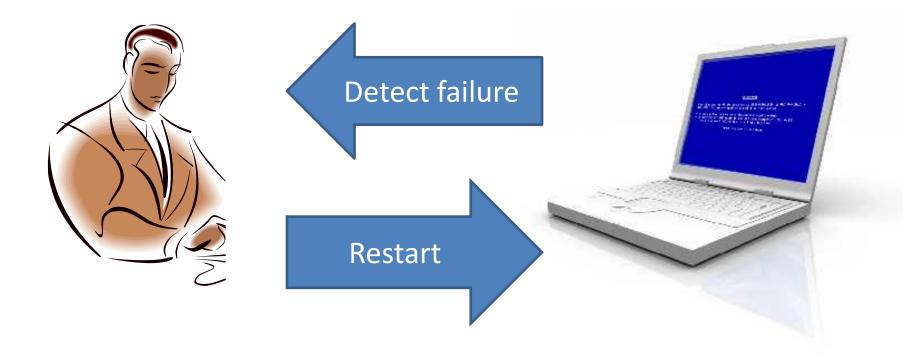

#### Windows

A fatal exception OE has occurred at 0028:C0011E36 in UXD UMM(01) + 00010E36. The current application will be terminated.

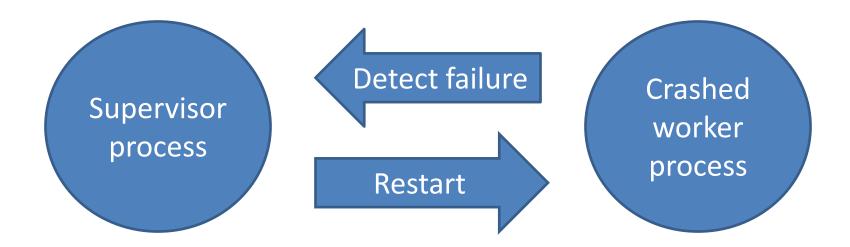

- \* Press any key to terminate the current application.
- Press CTRL+ALT+DEL again to restart your computer. You will lose any unsaved information in all applications.

Press any key to continue

# We know what to do...

# **Using Supervisor Processes**

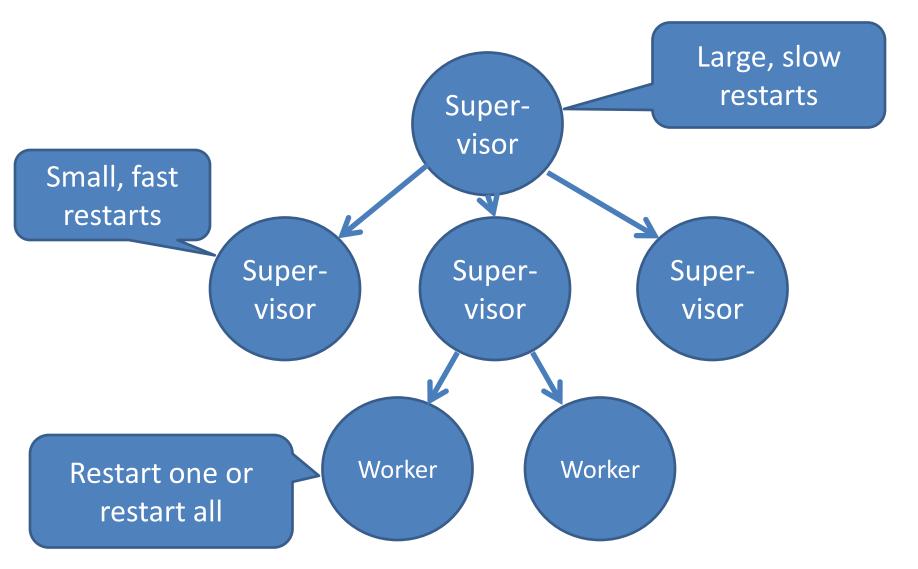

Supervisor process is not corrupted

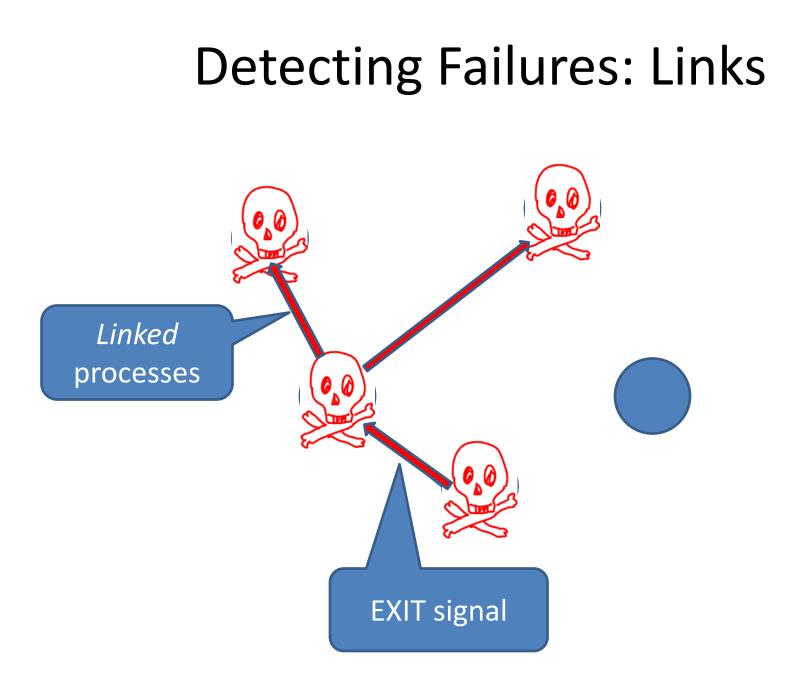

– One process *cannot* corrupt another

• Large grain error handling

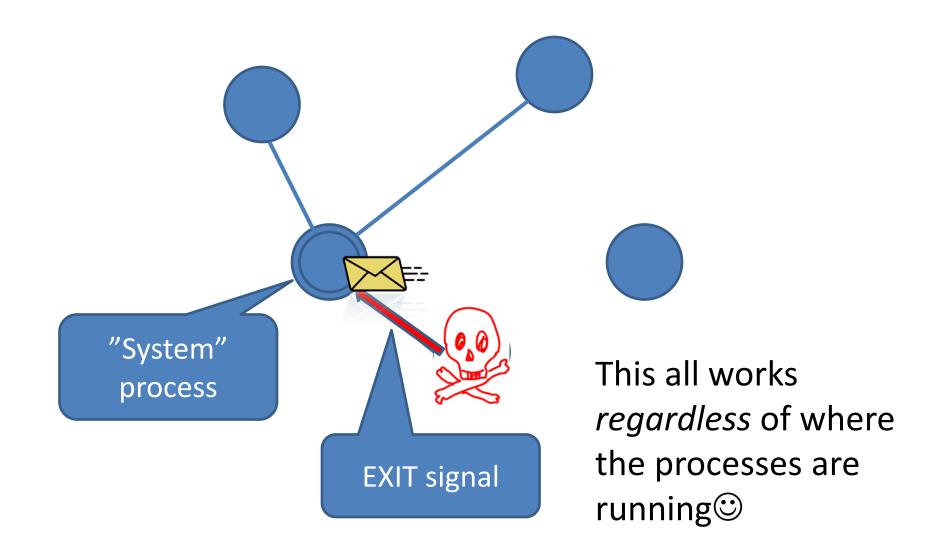

- simpler, smaller code

# **Supervision Trees**

### Linked Processes

# Creating a Link

- link(Pid)
  - Create a link between self() and Pid
  - When one process exits, an *exit signal* is sent to the other
  - Carries an exit reason (normal for successful
     termination)
- unlink(Pid)

- Remove a link between self() and Pid

### Two ways to spawn a process

• spawn(F)

- Start a new process, which calls F().

• spawn\_link(F)

- Spawn a new process and link to it atomically

# **Trapping Exits**

- An exit signal causes the recipient to exit also
   Unless the reason is normal
- ...unless the recipient is a system process
  - Creates a message in the mailbox:
    - {'EXIT', Pid, Reason}
  - Call process\_flag(trap\_exit, true) to
     become a system process

# An On-Exit Handler

Specify a function to be called when a process terminates

# Testing on\_exit

```
5> Pid = spawn(fun()->receive N -> 1/N end end).
<0.55.0>
6> test:on exit(Pid,fun(Why)->
           io:format("***exit: ~p\n",[Why]) end).
<0.57.0>
7> Pid ! 1.
***exit: normal
1
8 Pid2 = spawn(fun()->receive N -> 1/N end end).
<0.60.0>
9> test:on exit(Pid2,fun(Why)->
         io:format("***exit: ~p\n",[Why]) end).
<0.62.0>
10> Pid2 ! 0.
=ERROR REPORT==== 25-Apr-2012::19:57:07 ===
Error in process <0.60.0> with exit value:
{badarith,[{erlang, '/', [1,0], []}]}
***exit: {badarith, [{erlang, '/', [1,0], []}]}
0
```

# A Simple Supervi

- Keep a server alive at all times
  - Restart it whenever it terminates

Real supervisors won't restart too often—pass the failure up the hierarchy

keep\_alive(Fun) ->
 Pid = spawn(Fun),
 on\_exit(Pid,fun(\_) -> keep\_alive(Fun) end).

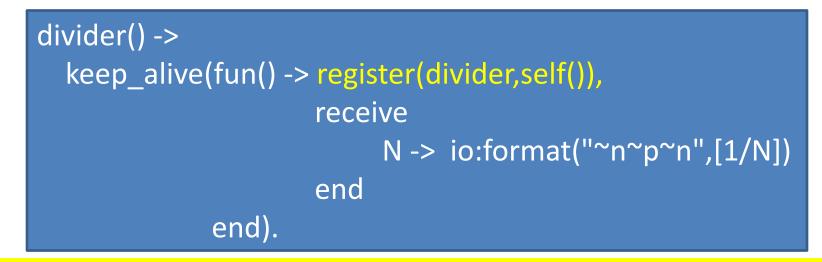

• Just one problem...

How will anyone ever communicate with Pid?

# The Process Registry

- Associate *names* (atoms) with pids
- Enable other processes to find pids of servers, using
  - register(Name,Pid)
    - Enter a process in the registry
  - unregister(Name)
    - Remove a process from the registry
  - whereis(Name)
    - Look up a process in the registry

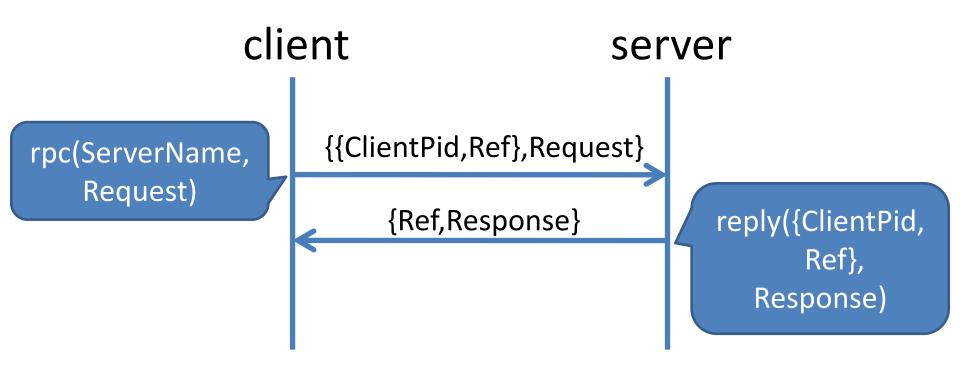

# A Supervised Divider

#### 4> divider ! 0.

# Supervisors supervise servers

- At the leaves of a supervision tree are processes that service requests
- Let's decide on a protocol

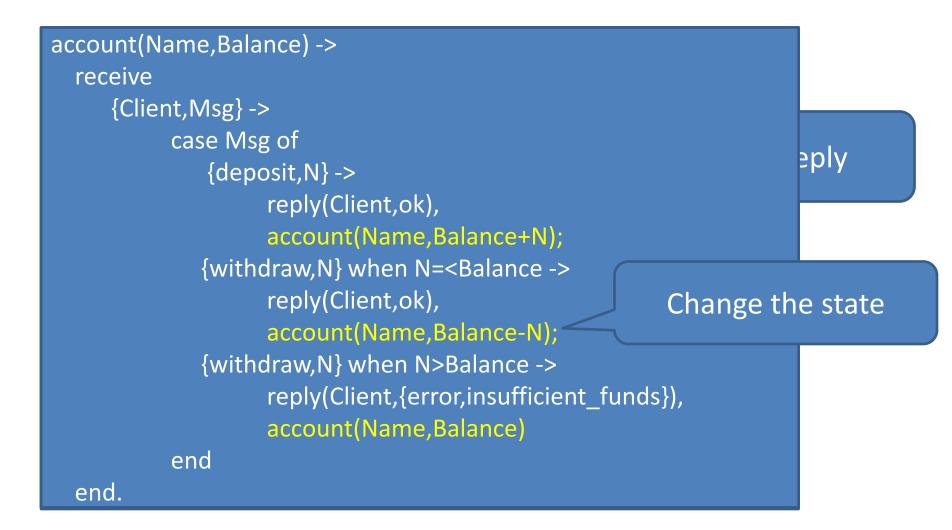

# rpc/reply

```
rpc(ServerName,Request) ->
  Ref = make_ref(),
  ServerName ! {{self(),Ref},Request},
  receive
     {Ref,Response} ->
        Response
  end.
```

reply({ClientPid,Ref},Response) ->
ClientPid ! {Ref,Response}.

# **Example Server**

# A Generic Server

- Decompose a server into...
  - A generic part that handles client—server communication
  - A specific part that defines functionality for this particular server
- Generic part: receives requests, sends replies, recurses with new state
- Specific part: *computes* the replies and new state

# A Factored Server

server(State) ->
receive {Client,Msg} -> {Reply,NewState} = handle(Msg,State),
reply(Client,Reply),
server(NewState) How do we

end.

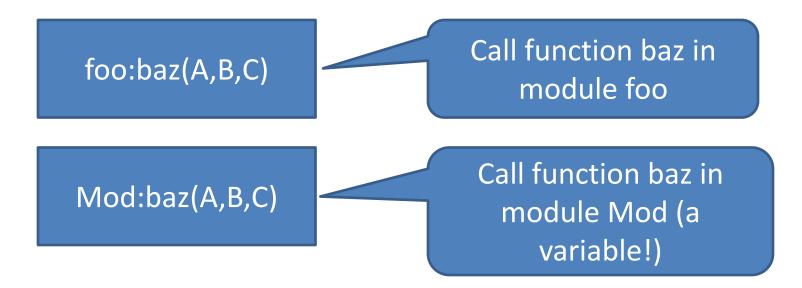

handle(Msg,Balance) ->

How do we parameterise the server on the callback?

case Msg of
 {deposit,N} -> {ok, Balance+N};
 {withdraw,N} when N=<Balance -> {ok, Balance-N};
 {withdraw,N} when N>Balance ->
 {{error,insufficient\_funds}, Balance}
end.

# **Callback Modules**

• Remember:

 Passing a module *name* is sufficient to give access to a collection of "callback" functions

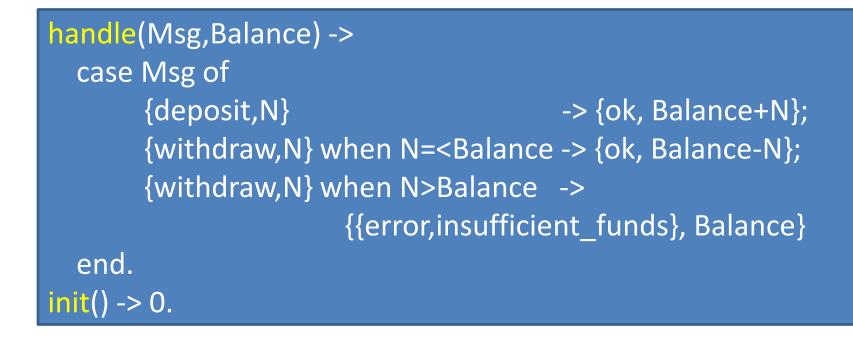

# A Generic Server

server(Mod,State) ->
receive {Client,Msg} ->
{Reply,NewState} = Mod:handle(Msg,State),
reply(Client,Reply),
server(Mod,NewState)

end.

new\_server(Name,Mod) ->
 keep\_alive(fun() -> register(Name,self()),
 server(Mod,Mod:init()) end).

# The Bank Account Module

- This is *purely sequential* (and hence easy) code
- This is all the application programmer needs to write

#### What Happens If...

Is this what

we want?

- The client makes a bad call, and...
- The handle callback crashes?

- The *server* crashes
- The *client* waits for ever for a reply

• Let's make the *client* crash instead

#### **Erlang Exception Handling**

catch <expr>

• Evaluates to V, if <expr> evaluates to V

 Evaluates to {'EXIT', Reason} if expr throws an exception with reason Reason

## Generic S

#### server(Mod,State) ->

receive
{Pid,Msg} ->
{Pid,Msg} ->
Reply
case catch Mod:hand end.
{'EXIT',Reason} ->
reply(Name,Pid, {crash,Reason}),
server(Mod,. State );
{Reply,NewState} ->
reply(Name,Pid, {ok,Reply}),
What sh
server(Mod,NewState) put l

What should we put here?

end

end.

We don't have a new state!

rpc(Name,Msg) ->

{Ref,{crash,Reason}} ->

exit(Reason);

receive

#### **Transaction Semantics**

- The Mk II server supports *transaction semantics* 
  - When a request crashes, the *client* crashes...
  - ...but the server state is restored to the state before the request

• Other clients are unaffected by the crashes

### Hot Code Swapping

- Suppose we want to change the code that the server is running
  - It's sufficient to change the *module* that the callbacks are taken from

```
server(Mod,State) ->
receive
{Client, {code_change,NewMod}} ->
reply(Client,{ok,ok}),
server(NewMod,State);
{Client,Msg} -> ...
end.
```

#### Two Difficult Things Before Breakfast

- Implementing transactional semantics in a server
- Implementing dynamic code upgrade *without losing the state*

#### Why was it easy?

- Because all of the state is captured in a single value...
- ...and the state is updated by a pure function

### gen\_server for real

- 6 call-backs
  - init
  - handle\_call
  - handle\_cast—messages with no reply
  - handle\_info—timeouts/unexpected messages
  - terminate
  - code\_change
- Tracing and logging, supervision, system messages...
- 70% of the code in real Erlang systems

#### OTP

- A handful of generic behaviours
  - gen\_server
  - gen\_fsm—traverses a finite graph of states
  - gen\_event—event handlers
  - supervisor—tracks supervision tree+restart strategies
- And there are other more specialised behaviours...
  - gen\_leader—leader election

### Erlang's Secret

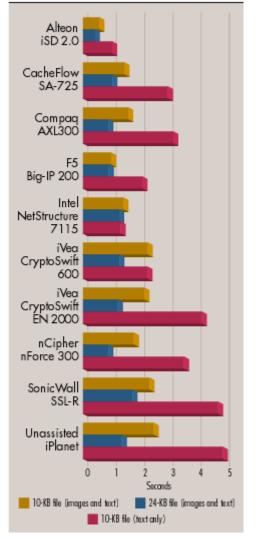

- Highly robust
- Highly scalable
- Ideal for internet servers

- 1998: Open Source Erlang (banned in Ericsson)
- First Erlang start-up: Bluetail
  - Bought by Alteon Websystems
    - Bought by Nortel Networks

\$140 million in <18 months

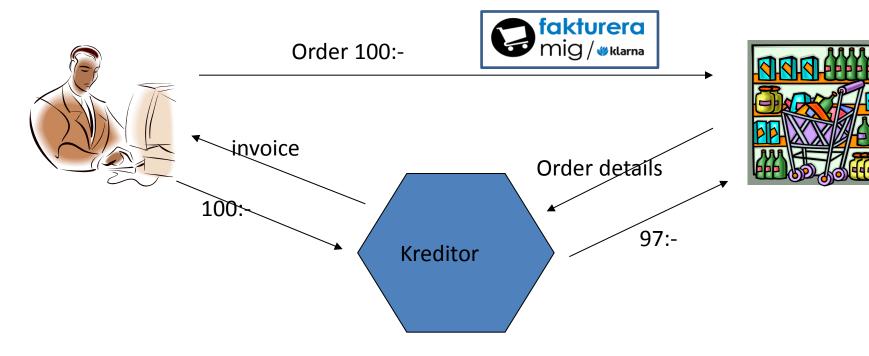

#### SSL Accelerator

- "Alteon WebSystems' SSL Accelerator offers phenomenal performance, management and scalability."
  - Network Computing

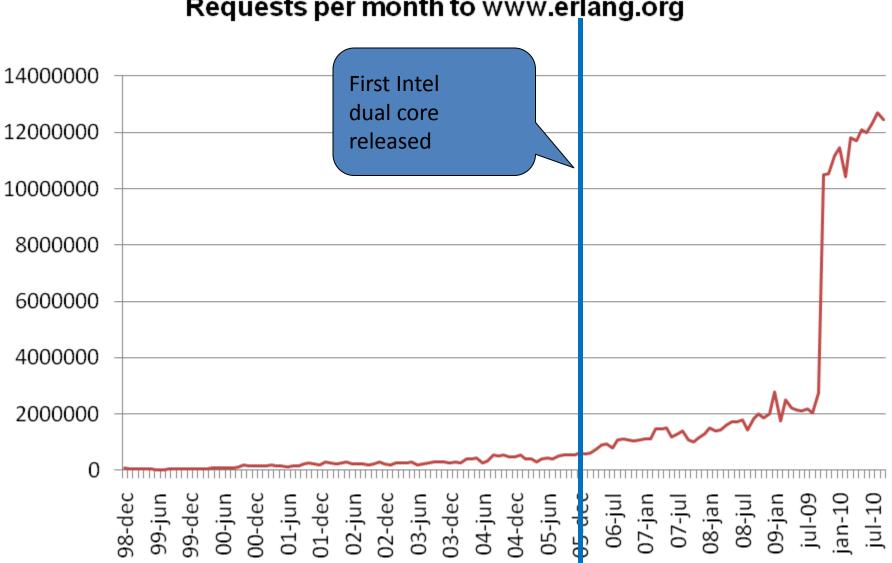

#### 2004 Start-up: Kreditor

- New features every few weeks—never down
- "Company of the year" in 2007
- Growth : >13,000% (to over 700 people!)
- Market leader in Scandinavia

## **Erlang Today**

- Scaling well on multicores
   64 cores, no problem!
- Many companies, large and small
  - Amazon/Facebook/Nokia/Motorola/HP...
  - Ericsson recruiting Erlangers
  - No-sql databases (Basho, CouchDB, Hibari...)
  - Many many start-ups
- "Erlang style concurrency" widely copied
   Akka in Scala (powers Twitter), Cloud Haskell...

#### Requests per month to www.erlang.org

### **Erlang Events**

- Erlang User Conference, Stockholm
- Erlang Factory (multiple tracks)

– London

– San Francisco

- Erlang Factory Lite
  - Brisbane, Paris, Munich, Edinburgh, Amsterdam
  - Brussels, Krakow, Zurich, St.Andrews...
- ErlangCamp
  - Chicago, Spain...

#### Coming up on Thursday...

# MAP/REDUCE
