

Model-Based Testing

(DIT848 / DAT260)

Spring 2015

Lecture 9

Graph Theory Techniques in MBT

Gerardo Schneider

Department of Computer Science and Engineering
Chalmers | University of Gothenburg

Outline

- *Graph Theory Techniques in Model-Based Testing*, **by**, Harry Robinson
- Interactive exercises

Euler Graph

Is it an Euler Graph?

Answer: No, not possible to traverse all the edges without repetition (nodes A and B have an odd number of links)

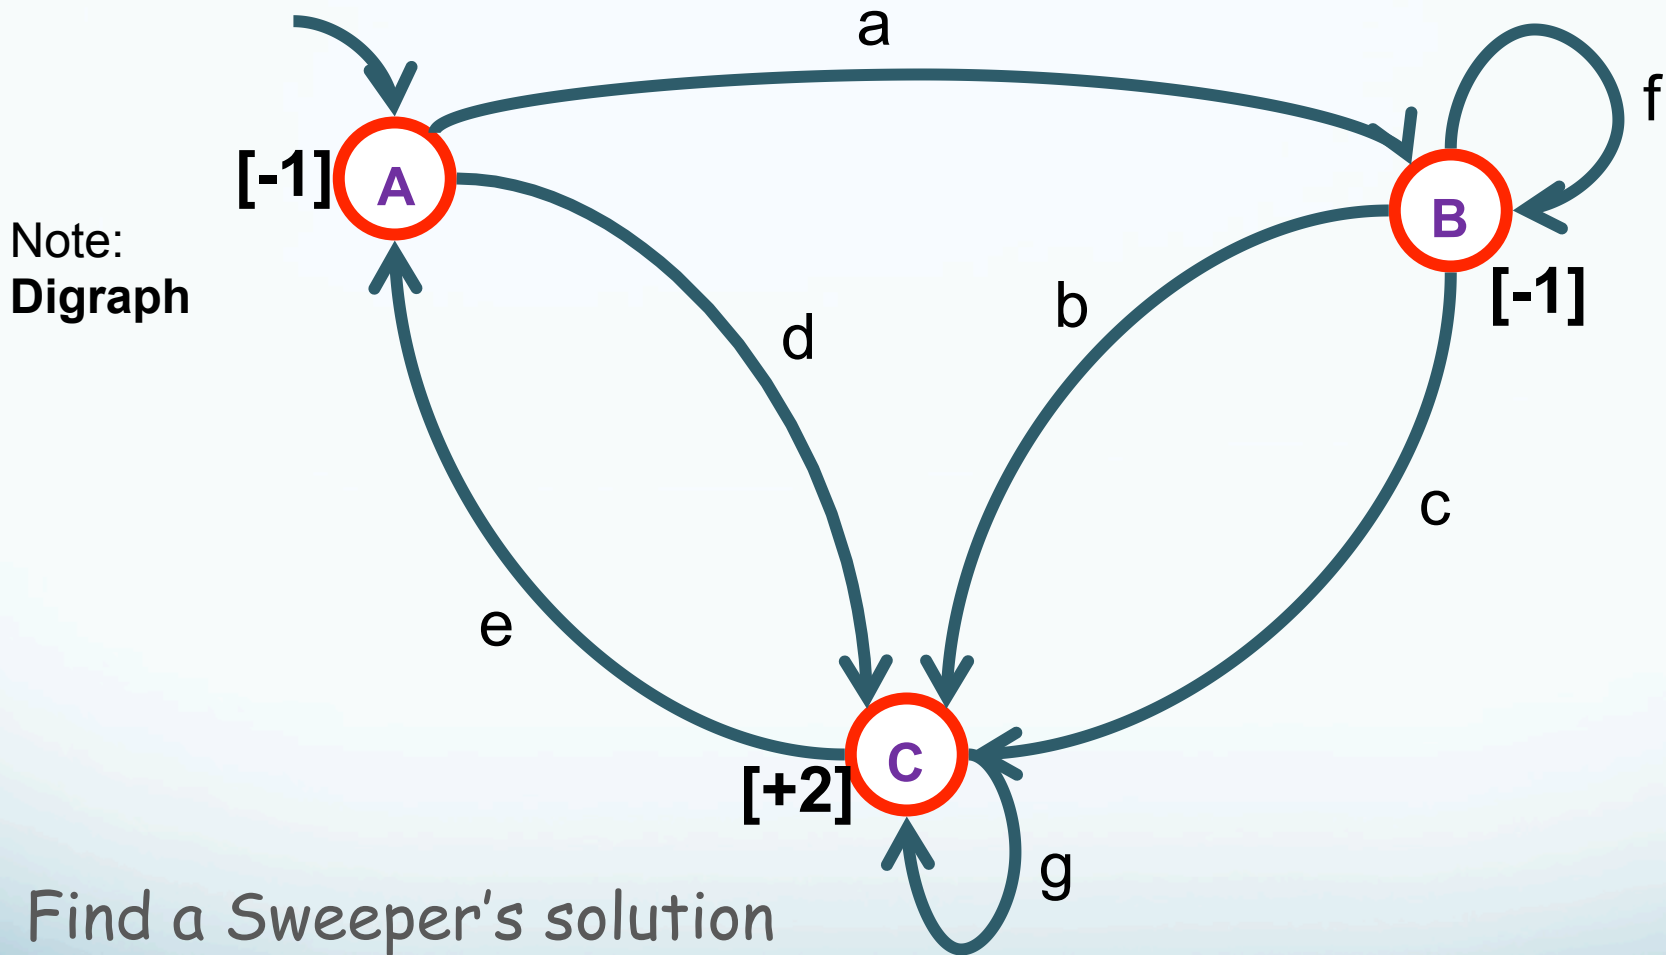

Postman Problem

Find a "Chinese" Postman's solution

Answer: "Eulerize" the graph (afbgca'de)

New York Street Sweeper

Answer: "Eulerize" the Digraph

New York Street Sweeper

Note:
Digraph

Find a Sweeper's solution

"Proposal 1": afbhcgede'

-> NOT A SOLUTION! (we assume there is another "street" from C till B)

New York Street Sweeper

Note:
Digraph

Find a Sweeper's solution

Solution: `afbgea'ce'de''` (we only use existing "streets")

Testing Combination of Actions

Test *link combinations*
(2 actions: all pairs of adjacent actions)

Solution: Transform the graph using de Bruijn's algorithm (**dual digraph**)

Testing Combination of Actions

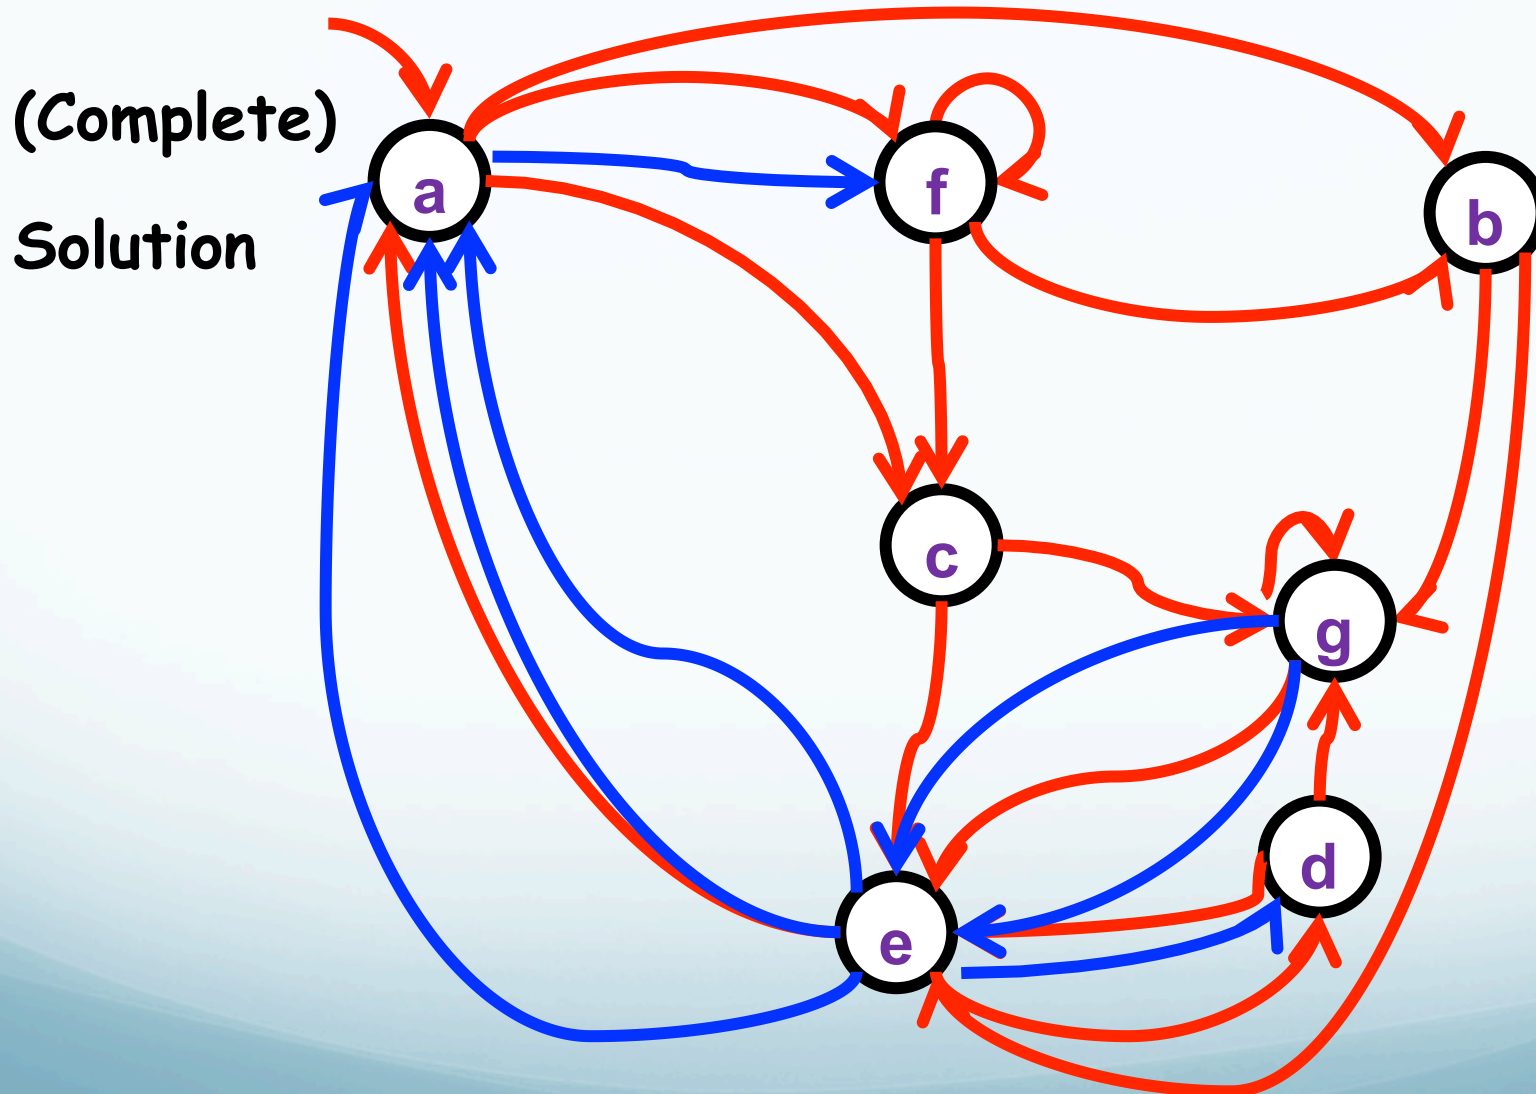

Solution

Problems:

- "Forgot" transition $f \rightarrow b$
- Need to "Eulerize" the resulting graph

Testing Combination of Actions

Testing under a Time Deadline

Solution 1: 5 hs
(not repeating tests)

M1: **afbe** (4 hs)
M2: **dhcge'** (5 hs)

Solution 2: 4 hs
(repeating some tests)

M1: **afce** (4 hs)
M2: **acge** (4 hs)
M3: **dhbe** (4 hs)

Assuming the above
Digraph, parallelize from
initial state

Current minimum time: 9 hs (**afbhcgede'**)

11
Groups 2-5 persons: 7 min
