# Software Engineering using Formal Methods Reasoning about Programs with Dynamic Logic 

Wolfgang Ahrendt

6 October 2015

Part I

## Where are we?

## Where Are We?

before specification of JAVA programs with JML

## Where Are We?

before specification of JAVA programs with JML
now dynamic logic (DL) for resoning about JaVA programs

## Where Are We?

before specification of JAVA programs with JML
now dynamic logic (DL) for resoning about JaVA programs after that generating DL from JML+JAVA

## Where Are We?

before specification of JAVA programs with JML
now dynamic logic (DL) for resoning about JaVA programs after that generating DL from JML+JAVA

+ verifying the resulting proof obligations

## Motivation

Consider the method

```
public void doubleContent(int[] a) {
    int i = 0;
    while (i < a.length) {
        a[i] = a[i] * 2;
        i++;
    }
}
```

## Motivation

Consider the method

```
public void doubleContent(int[] a) {
    int i = 0;
    while (i < a.length) {
        a[i] = a[i] * 2;
        i++;
    }
}
```

We want a logic/calculus allowing to express/prove properties like, e.g.:

## Motivation

Consider the method

```
public void doubleContent(int[] a) {
    int i = 0;
    while (i < a.length) {
        a[i] = a[i] * 2;
        i++;
    }
}
```

We want a logic/calculus allowing to express/prove properties like, e.g.:

If $\mathrm{a} \neq$ null
then doubleContent terminates normally and afterwards all elements of a are twice the old value

## Motivation Cont'd

One such logic is dynamic logic (DL)
The above statement can be expressed in DL as follows: (assuming a suitable signature)

```
    a \(\neq\) null
    \(\wedge\) a \(\neq\) old_a
    \(\wedge \forall\) int \(i ;\left((0 \leq i \wedge i<a . l e n g t h) \rightarrow a[i]=o l d \_a[i]\right)\)
\(\rightarrow\langle\) doubleContent (a); \(\rangle\)
    \(\forall\) int \(\mathrm{i} ;((0 \leq \mathrm{i} \wedge \mathrm{i}<\mathrm{a} .1 \mathrm{length}) \rightarrow \mathrm{a}[\mathrm{i}]=2 *\) old_a[i] \()\)
```

## Motivation Cont'd

One such logic is dynamic logic (DL)
The above statement can be expressed in DL as follows: (assuming a suitable signature)

$$
\begin{aligned}
& a \neq \text { null } \\
& \wedge \\
& a \neq \text { old_a } \\
& \wedge \text { int } i ;((0 \leq i \wedge i<\text { a.length }) \rightarrow a[i]=\text { old_a[i] }) \\
\rightarrow & \langle\text { doubleContent }(a) ;\rangle \\
& \forall \text { int } i ;((0 \leq i \wedge i<\text { a.length }) \rightarrow a[i]=2 * \text { old_a[i] })
\end{aligned}
$$

## Observations

- DL combines first-order logic (FOL) with programs
- Theory of DL extends theory of FOL

## Today

introducing dynamic logic for JAVA

- recap first-order logic (FOL)
- semantics of FOL
- dynamic logic $=$ extending FOL with
- dynamic interpretations
- programs to describe state change

## Repetition: First-Order Logic

## Signature

A first-order signature $\Sigma$ consists of

- a set $T_{\Sigma}$ of types
- a set $F_{\Sigma}$ of function symbols
- a set $P_{\Sigma}$ of predicate symbols

## Repetition: First-Order Logic

## Signature

A first-order signature $\Sigma$ consists of

- a set $T_{\Sigma}$ of types
- a set $F_{\Sigma}$ of function symbols
- a set $P_{\Sigma}$ of predicate symbols

## Type Declarations

- $\tau x$;
- $p\left(\tau_{1}, \ldots, \tau_{r}\right)$;
- $\tau f\left(\tau_{1}, \ldots, \tau_{r}\right)$;
'variable $x$ has type $\tau$ '
'predicate $p$ has argument types $\tau_{1}, \ldots, \tau_{r}$ '
'function $f$ has argument types $\tau_{1}, \ldots, \tau_{r}$ and result type $\tau^{\prime}$

## Part II

## First-Order Semantics

## First-Order Semantics

## From propositional to first-order semantics

- In prop. logic, an interpretation of variables with $\{T, F\}$ sufficed
- In first-order logic we must assign meaning to:
- function symbols (incl. constants)
- predicate symbols
- Respect typing: int i, List 1 must denote different elements

## First-Order Semantics

## From propositional to first-order semantics

- In prop. logic, an interpretation of variables with $\{T, F\}$ sufficed
- In first-order logic we must assign meaning to:
- function symbols (incl. constants)
- predicate symbols
- Respect typing: int i, List 1 must denote different elements

## What we need (to interpret a first-order formula)

1. A collection of typed universes of elements
2. A mapping from variables to elements
3. For each function symbol, a mapping from arguments to results
4. For each predicate symbol, a set of argument tuples where that predicate holds

## First-Order Domains/Universes

1. A collection of typed universes of elements

## Definition (Universe/Domain)

A non-empty set $\mathcal{D}$ of elements is a universe or domain. Each element of $\mathcal{D}$ has a fixed type given by $\delta: \mathcal{D} \rightarrow T_{\Sigma}$

- Notation for the domain elements of type $\tau \in T_{\Sigma}$ : $\mathcal{D}^{\tau}=\{d \in \mathcal{D} \mid \delta(d)=\tau\}$
- Each type $\tau \in T_{\Sigma}$ must 'contain' at least one domain element: $\mathcal{D}^{\tau} \neq \emptyset$

## First-Order States

3. For each function symbol, a mapping from arguments to results
4. For each predicate symbol, a set of argument tuples where that predicate holds

## Definition (First-Order State) <br> Let $\mathcal{D}$ be a domain with typing function $\delta$. <br> For each $f$ be declared as $\tau f\left(\tau_{1}, \ldots, \tau_{r}\right)$; and each $p$ be declared as $p\left(\tau_{1}, \ldots, \tau_{r}\right)$;

## First-Order States

3. For each function symbol, a mapping from arguments to results
4. For each predicate symbol, a set of argument tuples where that predicate holds

## Definition (First-Order State)

Let $\mathcal{D}$ be a domain with typing function $\delta$.
For each $f$ be declared as $\tau f\left(\tau_{1}, \ldots, \tau_{r}\right)$; and each $p$ be declared as $p\left(\tau_{1}, \ldots, \tau_{r}\right)$;
$\mathcal{I}(f)$ is a mapping $\mathcal{I}(f): \mathcal{D}^{\tau_{1}} \times \cdots \times \mathcal{D}^{\tau_{r}} \rightarrow \mathcal{D}^{\tau}$

## First-Order States

3. For each function symbol, a mapping from arguments to results
4. For each predicate symbol, a set of argument tuples where that predicate holds

## Definition (First-Order State)

Let $\mathcal{D}$ be a domain with typing function $\delta$.
For each $f$ be declared as $\tau f\left(\tau_{1}, \ldots, \tau_{r}\right)$; and each $p$ be declared as $p\left(\tau_{1}, \ldots, \tau_{r}\right)$;
$\mathcal{I}(f)$ is a mapping $\mathcal{I}(f): \mathcal{D}^{\tau_{1}} \times \cdots \times \mathcal{D}^{\tau_{r}} \rightarrow \mathcal{D}^{\tau}$
$\mathcal{I}(p)$ is a set $\mathcal{I}(p) \subseteq \mathcal{D}^{\tau_{1}} \times \cdots \times \mathcal{D}^{\tau_{r}}$

## First-Order States

3. For each function symbol, a mapping from arguments to results
4. For each predicate symbol, a set of argument tuples where that predicate holds

## Definition (First-Order State)

Let $\mathcal{D}$ be a domain with typing function $\delta$.
For each $f$ be declared as $\tau f\left(\tau_{1}, \ldots, \tau_{r}\right)$; and each $p$ be declared as $p\left(\tau_{1}, \ldots, \tau_{r}\right)$;
$\mathcal{I}(f)$ is a mapping $\mathcal{I}(f): \mathcal{D}^{\tau_{1}} \times \cdots \times \mathcal{D}^{\tau_{r}} \rightarrow \mathcal{D}^{\tau}$
$\mathcal{I}(p)$ is a set $\mathcal{I}(p) \subseteq \mathcal{D}^{\tau_{1}} \times \cdots \times \mathcal{D}^{\tau_{r}}$
Then $\mathcal{S}=(\mathcal{D}, \delta, \mathcal{I})$ is a first-order state

## First-Order States Cont'd

## Example

Signature: int i; int j; int f(int); Object obj; <(int,int);
$\mathcal{D}=\{17,2, o\}$

## First-Order States Cont'd

## Example

Signature: int i; int j; int f(int); Object obj; <(int,int);
$\mathcal{D}=\{17,2, o\}$
The following $\mathcal{I}$ is a possible interpretation:
$\mathcal{I}(i)=17$
$\mathcal{I}(j)=17$
$\mathcal{I}(\mathrm{obj})=0$

| $\mathcal{D}^{\text {int }}$ | $\mathcal{I}(f)$ |
| ---: | :---: |
| 2 | 2 |
| 17 | 2 |

| $\mathcal{D}^{\text {int }} \times \mathcal{D}^{\text {int }}$ | in $\mathcal{I}(<) ?$ |
| ---: | :---: |
| $(2,2)$ | no |
| $(2,17)$ | yes |
| $(17,2)$ | no |
| $(17,17)$ | no |

One of uncountably many possible first-order states!

## Semantics of Reserved Signature Symbols

Definition<br>Reserved predicate symbol for equality: =

## Semantics of Reserved Signature Symbols

## Definition

Reserved predicate symbol for equality: =
Interpretation is fixed as $\mathcal{I}(=)=$

## Semantics of Reserved Signature Symbols

## Definition

Reserved predicate symbol for equality: = Interpretation is fixed as $\mathcal{I}(=)=\{(d, d) \mid d \in \mathcal{D}\}$

## Semantics of Reserved Signature Symbols

## Definition

Reserved predicate symbol for equality: = Interpretation is fixed as $\mathcal{I}(=)=\{(d, d) \mid d \in \mathcal{D}\}$

Exercise: write down all elements of the set $\mathcal{I}(=)$ for example domain

## Signature Symbols vs. Domain Elements

- Domain elements different from the terms representing them
- First-order formulas and terms have no access to domain

## Example

Signature: Object obj1, obj2;
Domain: $\mathcal{D}=\{0\}$

## Signature Symbols vs. Domain Elements

- Domain elements different from the terms representing them
- First-order formulas and terms have no access to domain

## Example

Signature: Object obj1, obj2;
Domain: $\mathcal{D}=\{0\}$
In this state, necessarily $\mathcal{I}(o b j 1)=\mathcal{I}(o b j 2)=o$

## Variable Assignments

2. A mapping from variables to domain elements

## Definition (Variable Assignment)

A variable assignment $\beta$ maps variables to domain elements. It respects the variable type, i.e., if $x$ has type $\tau$ then $\beta(x) \in \mathcal{D}^{\tau}$.

## Semantic Evaluation of Terms

> Given a first-order state $\mathcal{S}$ and a variable assignment $\beta$ it is possible to evaluate first-order terms under $\mathcal{S}$ and $\beta$

## Definition (Valuation of Terms)

val $_{\mathcal{S}, \beta}: \operatorname{Term} \rightarrow \mathcal{D}$ such that val $_{\mathcal{S}, \beta}(t) \in \mathcal{D}^{\tau}$ for $t \in \operatorname{Term}_{\tau}$ :

- $\operatorname{val}_{\mathcal{S}, \beta}(x)=$

## Semantic Evaluation of Terms

> Given a first-order state $\mathcal{S}$ and a variable assignment $\beta$ it is possible to evaluate first-order terms under $\mathcal{S}$ and $\beta$

## Definition (Valuation of Terms)

val $_{\mathcal{S}, \beta}:$ Term $\rightarrow \mathcal{D}$ such that val $_{\mathcal{S}, \beta}(t) \in \mathcal{D}^{\tau}$ for $t \in \operatorname{Term}_{\tau}$ :

- $\operatorname{val}_{\mathcal{S}, \beta}(x)=\beta(x)$

## Semantic Evaluation of Terms

> Given a first-order state $\mathcal{S}$ and a variable assignment $\beta$ it is possible to evaluate first-order terms under $\mathcal{S}$ and $\beta$

## Definition (Valuation of Terms)

val $_{\mathcal{S}, \beta}:$ Term $\rightarrow \mathcal{D}$ such that val $_{\mathcal{S}, \beta}(t) \in \mathcal{D}^{\tau}$ for $t \in \operatorname{Term}_{\tau}$ :

- $\operatorname{val}_{\mathcal{S}, \beta}(x)=\beta(x)$
- $\operatorname{val}_{\mathcal{S}, \beta}\left(f\left(t_{1}, \ldots, t_{r}\right)\right)=$

## Semantic Evaluation of Terms

Given a first-order state $\mathcal{S}$ and a variable assignment $\beta$ it is possible to evaluate first-order terms under $\mathcal{S}$ and $\beta$

## Definition (Valuation of Terms)

 val $_{\mathcal{S}, \beta}:$ Term $\rightarrow \mathcal{D}$ such that val $_{\mathcal{S}, \beta}(t) \in \mathcal{D}^{\tau}$ for $t \in \operatorname{Term}_{\tau}$ :- $\operatorname{val}_{\mathcal{S}, \beta}(x)=\beta(x)$
- $\operatorname{val}_{\mathcal{S}, \beta}\left(f\left(t_{1}, \ldots, t_{r}\right)\right)=\mathcal{I}(f)\left(\operatorname{val}_{\mathcal{S}, \beta}\left(t_{1}\right), \ldots, \operatorname{val}_{\mathcal{S}, \beta}\left(t_{r}\right)\right)$

## Semantic Evaluation of Terms Cont'd

## Example

Signature: int i; int j; int f(int);
$\mathcal{D}=\{17,2, o\}$
Variables: Object obj; int $x$;

$$
\begin{aligned}
& \mathcal{I}(i)=17 \\
& \mathcal{I}(j)=17
\end{aligned}
$$

| $\mathcal{D}^{\text {int }}$ | $\mathcal{I}(\mathrm{f})$ |
| ---: | :---: |
| 2 | 17 |
| 17 | 2 |

| Var | $\beta$ |
| ---: | :---: |
| obj | $o$ |
| x | 17 |

- $\quad$ val $l_{\mathcal{S}, \beta}(\mathrm{f}(\mathrm{f}(\mathrm{i})))$ ?
- $\operatorname{val}_{\mathcal{S}, \beta}(\mathrm{f}(\mathrm{f}(\mathrm{x})))$ ?
- val $\mathcal{S}, \beta(\mathrm{obj})$ ?

## Preparing for Semantic Evaluation of Formulas

## Definition (Modified Variable Assignment)

Let $y$ be variable of type $\tau, \beta$ variable assignment, $d \in \mathcal{D}^{\tau}$.

$$
\beta_{y}^{d}(x):= \begin{cases}\beta(x) & x \neq y \\ d & x=y\end{cases}
$$

## Preparing for Semantic Evaluation of Formulas

## Definition (Modified Variable Assignment)

Let $y$ be variable of type $\tau, \beta$ variable assignment, $d \in \mathcal{D}^{\tau}$.

$$
\beta_{y}^{d}(x):= \begin{cases}\beta(x) & x \neq y \\ d & x=y\end{cases}
$$

Needed for semantics of quantifiers.

## Semantic Evaluation of Formulas

## Definition (Valuation of Formulas)

$\operatorname{val}_{\mathcal{S}, \beta}(\phi)$ for $\phi \in$ For
$-\operatorname{val}_{\mathcal{S}, \beta}\left(p\left(t_{1}, \ldots, t_{r}\right)\right)=T \quad$ iff $\quad\left(\operatorname{val}_{\mathcal{S}, \beta}\left(t_{1}\right), \ldots\right.$, val $\left._{\mathcal{S}, \beta}\left(t_{r}\right)\right) \in \mathcal{I}(p)$

## Semantic Evaluation of Formulas

## Definition (Valuation of Formulas)

val $\mathcal{S}_{\mathcal{S}, \beta}(\phi)$ for $\phi \in$ For

- $\operatorname{val}_{\mathcal{S}, \beta}\left(p\left(t_{1}, \ldots, t_{r}\right)\right)=T \quad$ iff $\quad\left(\right.$ val $_{\mathcal{S}, \beta}\left(t_{1}\right), \ldots$, val $\left._{\mathcal{S}, \beta}\left(t_{r}\right)\right) \in \mathcal{I}(p)$
- $\operatorname{val}_{\mathcal{S}, \beta}(\phi \wedge \psi)=T \quad$ iff $\quad \operatorname{val}_{\mathcal{S}, \beta}(\phi)=T$ and $\operatorname{val}_{\mathcal{S}, \beta}(\psi)=T$
- (also true, false, $\vee, \neg, \rightarrow, \leftrightarrow$ like valuation in propositional logic)

## Semantic Evaluation of Formulas

## Definition (Valuation of Formulas)

val $\mathcal{S}_{\mathcal{S}, \beta}(\phi)$ for $\phi \in$ For

- $\operatorname{val}_{\mathcal{S}, \beta}\left(p\left(t_{1}, \ldots, t_{r}\right)\right)=T \quad$ iff $\quad\left(\right.$ val $_{\mathcal{S}, \beta}\left(t_{1}\right), \ldots$, val $\left._{\mathcal{S}, \beta}\left(t_{r}\right)\right) \in \mathcal{I}(p)$
- $\operatorname{val}_{\mathcal{S}, \beta}(\phi \wedge \psi)=T \quad$ iff $\quad \operatorname{val}_{\mathcal{S}, \beta}(\phi)=T$ and $v a l_{\mathcal{S}, \beta}(\psi)=T$
- (also true, false, $\vee, \neg, \rightarrow, \leftrightarrow$ like valuation in propositional logic)
- $\operatorname{val}_{\mathcal{S}, \beta}(\forall \tau x ; \phi)=T$ iff

## Semantic Evaluation of Formulas

## Definition (Valuation of Formulas)

val ${ }_{\mathcal{S}, \beta}(\phi)$ for $\phi \in$ For

- $\operatorname{val}_{\mathcal{S}, \beta}\left(p\left(t_{1}, \ldots, t_{r}\right)\right)=T \quad$ iff $\quad\left(\right.$ val $_{\mathcal{S}, \beta}\left(t_{1}\right), \ldots$, val $\left._{\mathcal{S}, \beta}\left(t_{r}\right)\right) \in \mathcal{I}(p)$
- $\operatorname{val}_{\mathcal{S}, \beta}(\phi \wedge \psi)=T \quad$ iff $\quad \operatorname{val}_{\mathcal{S}, \beta}(\phi)=T$ and $v a l_{\mathcal{S}, \beta}(\psi)=T$
- (also true, false, $\vee, \neg, \rightarrow, \leftrightarrow$ like valuation in propositional logic)
- $\operatorname{val}_{\mathcal{S}, \beta}(\forall \tau x ; \phi)=T \quad$ iff $\quad v a l_{\mathcal{S}, \beta_{x}^{d}}(\phi)=T$ for all $d \in \mathcal{D}^{\tau}$

## Semantic Evaluation of Formulas

## Definition (Valuation of Formulas)

val $\mathcal{S}_{\mathcal{S}, \beta}(\phi)$ for $\phi \in$ For

- $\operatorname{val}_{\mathcal{S}, \beta}\left(p\left(t_{1}, \ldots, t_{r}\right)\right)=T \quad$ iff $\quad\left(\right.$ val $_{\mathcal{S}, \beta}\left(t_{1}\right), \ldots$, val $\left._{\mathcal{S}, \beta}\left(t_{r}\right)\right) \in \mathcal{I}(p)$
- $\operatorname{val}_{\mathcal{S}, \beta}(\phi \wedge \psi)=T \quad$ iff $\quad \operatorname{val}_{\mathcal{S}, \beta}(\phi)=T$ and $\operatorname{val}_{\mathcal{S}, \beta}(\psi)=T$
- (also true, false, $\vee, \neg, \rightarrow, \leftrightarrow$ like valuation in propositional logic)
- $\operatorname{val}_{\mathcal{S}, \beta}(\forall \tau x ; \phi)=T \quad$ iff $\quad$ val $l_{\mathcal{S}, \beta_{x}^{d}}(\phi)=T$ for all $d \in \mathcal{D}^{\tau}$
- $\operatorname{val}_{\mathcal{S}, \beta}(\exists \tau x ; \phi)=T \quad$ iff

## Semantic Evaluation of Formulas

## Definition (Valuation of Formulas)

val ${ }_{\mathcal{S}, \beta}(\phi)$ for $\phi \in$ For

- $\operatorname{val}_{\mathcal{S}, \beta}\left(p\left(t_{1}, \ldots, t_{r}\right)\right)=T \quad$ iff $\quad\left(\right.$ val $_{\mathcal{S}, \beta}\left(t_{1}\right), \ldots$, val $\left._{\mathcal{S}, \beta}\left(t_{r}\right)\right) \in \mathcal{I}(p)$
- $\operatorname{val}_{\mathcal{S}, \beta}(\phi \wedge \psi)=T \quad$ iff $\quad \operatorname{val}_{\mathcal{S}, \beta}(\phi)=T$ and $\operatorname{val}_{\mathcal{S}, \beta}(\psi)=T$
- (also true, false, $\vee, \neg, \rightarrow, \leftrightarrow$ like valuation in propositional logic)
- $\operatorname{va} l_{\mathcal{S}, \beta}(\forall \tau x ; \phi)=T \quad$ iff $\quad v a l_{\mathcal{S}, \beta_{x}^{d}}(\phi)=T$ for all $d \in \mathcal{D}^{\tau}$
- $\operatorname{val}_{\mathcal{S}, \beta}(\exists \tau x ; \phi)=T \quad$ iff $\quad \operatorname{val}_{\mathcal{S}, \beta_{x}^{d}}(\phi)=T$ for at least one $d \in \mathcal{D}^{\tau}$

## Semantic Evaluation of Formulas Cont'd

## Example

Signature: int j; int f(int); Object obj; <(int,int);
$\mathcal{D}=\{17,2, o\}, \mathcal{D}^{\text {int }}=\{17,2\}, \mathcal{D}^{\text {Object }}=\{o\}$
$\mathcal{I}(j)=17$
$\mathcal{I}(\mathrm{obj})=0$

| $\mathcal{D}^{\text {int }}$ | $\mathcal{I}(f)$ |
| ---: | :---: |
| 2 | 2 |
| 17 | 2 |

| $\mathcal{D}^{\text {int }} \times \mathcal{D}^{\text {int }}$ | in $\mathcal{I}(<) ?$ |
| ---: | :---: |
| $(2,2)$ | $F$ |
| $(2,17)$ | $T$ |
| $(17,2)$ | $F$ |
| $(17,17)$ | $F$ |

## Semantic Evaluation of Formulas Cont'd

## Example

Signature: int j; int f(int); Object obj; <(int,int);
$\mathcal{D}=\{17,2, o\}, \mathcal{D}^{\text {int }}=\{17,2\}, \mathcal{D}^{\text {Object }}=\{o\}$
$\mathcal{I}(j)=17$
$\mathcal{I}(\mathrm{obj})=0$

| $\mathcal{D}^{\text {int }}$ | $\mathcal{I}(f)$ |
| ---: | :---: |
| 2 | 2 |
| 17 | 2 |

| $\mathcal{D}^{\text {int }} \times \mathcal{D}^{\text {int }}$ | in $\mathcal{I}(<) ?$ |
| ---: | :---: |
| $(2,2)$ | $F$ |
| $(2,17)$ | $T$ |
| $(17,2)$ | $F$ |
| $(17,17)$ | $F$ |

- $\operatorname{val}_{\mathcal{S}, \beta}(f(j)<j)$ ?
- val $\mathcal{S}_{\mathcal{S}, \beta}(\exists \operatorname{int} x ; f(x)=x)$ ?
$-v a l_{\mathcal{S}, \beta}(\forall$ Object o1; $\forall$ Object o2; o1 $=o 2)$ ?

## Semantic Notions

## Definition (Truth, Satisfiability, Validity)

$$
\operatorname{va}_{\mathcal{S}, \beta}(\phi)=T
$$

$(\mathcal{S}, \beta$ satisfies $\phi)$

## Semantic Notions

## Definition (Truth, Satisfiability, Validity)

$$
\begin{array}{cll}
\operatorname{val}_{\mathcal{S}, \beta}(\phi)=T & & (\mathcal{S}, \beta \text { satisfies } \\
\mathcal{S} \models \phi & \text { iff } \quad \text { for all } \beta: \text { val }_{\mathcal{S}, \beta}(\phi)=T & (\phi \text { is true in } \mathcal{S})
\end{array}
$$

## Semantic Notions

## Definition (Truth, Satisfiability, Validity)

$$
\begin{array}{clll}
\operatorname{val}_{\mathcal{S}, \beta}(\phi)=T & & (\mathcal{S}, \beta \text { satisfies } \phi) \\
\mathcal{S} \models \phi & \text { iff } & \text { for all } \beta: \text { val }_{\mathcal{S}, \beta}(\phi)=T & (\phi \text { is true in } \mathcal{S}) \\
\operatorname{SAT}(\phi) & \text { iff } & \text { for some } \mathcal{S}: \mathcal{S} \models \phi & (\phi \text { is satisfiable })
\end{array}
$$

## Semantic Notions

## Definition (Truth, Satisfiability, Validity)

$\operatorname{val}_{\mathcal{S}, \beta}(\phi)=T$
$\mathcal{S} \models \phi \quad$ iff $\quad$ for all $\beta:$ val $_{\mathcal{S}, \beta}(\phi)=T$
SAT $(\phi)$
$1=\phi$
iff for some $\mathcal{S}: \mathcal{S}=\phi$
$(\mathcal{S}, \beta$ satisfies $\phi)$
( $\phi$ is true in $\mathcal{S}$ )
( $\phi$ is satisfiable)
( $\phi$ is valid)

## Semantic Notions

## Definition (Truth, Satisfiability, Validity)

$\mathrm{val}_{\mathcal{S}, \beta}(\phi)=T$
$\mathcal{S} \models \phi \quad$ iff $\quad$ for all $\beta:$ val $_{\mathcal{S} \beta}(\phi)=T$
SAT $(\phi)$
$\vDash \phi \quad$ if
iff for all $\mathcal{S}: \quad \mathcal{S} \models \phi$
( $\mathcal{S}, \beta$ satisfies $\phi$ )
( $\phi$ is true in $\mathcal{S}$ )
( $\phi$ is satisfiable)
( $\phi$ is valid)

## Example

- $f(j)<j$ is true in $\mathcal{S}$
- $\exists$ int $x ; i=x$ is valid
- $\exists$ int $x ; \neg(x=x)$ is not satisfiable

## Part III

## Towards Dynamic Logic

## Towards Dynamic Logic

Reasoning about Java programs requires extensions of FOL

- Java type hierarchy
- Java program variables
- Java heap for reference types (next lecture)

## Type Hierarchy

## Definition (Type Hierarchy)

- $T_{\Sigma}$ is set of types
- Subtype relation $\sqsubseteq \subseteq T_{\Sigma} \times T_{\Sigma}$ with top element $T$
- $\tau \sqsubseteq T$ for all $\tau \in T_{\Sigma}$

## Type Hierarchy

```
Definition (Type Hierarchy)
    - \(T_{\Sigma}\) is set of types
    - Subtype relation \(\sqsubseteq \subseteq T_{\Sigma} \times T_{\Sigma}\) with top element \(T\)
    - \(\tau \sqsubseteq T\) for all \(\tau \in T_{\Sigma}\)
```

Example (A Minimal Type Hierarchy)
$T_{\Sigma}=\{\top\}$
All signature symbols have same type $T$

## Example (Type Hierarchy for Java) (see next slide)

## Modelling Java in FOL: Fixing a Type Hierarchy

Signature based on Java's type hierarchy

Each interface and class in API and in target program becomes type with appropriate subtype relation

## Subset of Types

Signature based on Java's type hierarchy

int and boolean are the only types for today Class, interface types, etc., in next lecture

## Modelling Dynamic Properties

Only static properties expressable in typed FOL, e.g.,

- Values of fields in a certain range
- Property (invariant) of a subclass implies property of a superclass

Considers only one program state at a time

## Modelling Dynamic Properties

Only static properties expressable in typed FOL, e.g.,

- Values of fields in a certain range
- Property (invariant) of a subclass implies property of a superclass

Considers only one program state at a time
Goal: Express behavior of a program, e.g.:
If method setAge is called on an object o of type Person and the method argument newAge is positive then afterwards field age has same value as newAge

## Requirements

## Requirements for a logic to reason about programs

## Requirements

## Requirements for a logic to reason about programs

- can relate different program states, i.e., before and after execution, within a single formula

## Requirements

## Requirements for a logic to reason about programs

- can relate different program states, i.e., before and after execution, within a single formula
- program variables are represented by constant symbols that depend on current program state

## Requirements

## Requirements for a logic to reason about programs

- can relate different program states, i.e., before and after execution, within a single formula
- program variables are represented by constant symbols that depend on current program state

## Dynamic Logic meets the above requirements

## Dynamic Logic

(Java) Dynamic Logic

## Typed FOL

-     + programs p
-     + modalities $\langle\mathrm{p}\rangle \phi,[\mathrm{p}] \phi$ (p program, $\phi \mathrm{DL}$ formula)
$-\quad+\ldots$ (later)

## Dynamic Logic

(Java) Dynamic Logic

## Typed FOL

-     + programs p
-+ modalities $\langle\mathrm{p}\rangle \phi,[\mathrm{p}] \phi$ (p program, $\phi$ DL formula)
$-\quad+\ldots$ (later)

An Example

$$
i>5 \rightarrow[i=i+10 ;] i>15
$$

Meaning?

## Dynamic Logic

(Java) Dynamic Logic

## Typed FOL

-     + programs p
-     + modalities $\langle\mathrm{p}\rangle \phi,[\mathrm{p}] \phi$ (p program, $\phi$ DL formula)
$-+\ldots$ (later)

An Example

$$
i>5 \rightarrow[i=i+10 ;] i>15
$$

Meaning?
If program variable $i$ is greater than 5 in current state, then after executing the Java statement " $\mathrm{i}=\mathrm{i}+10$;", i is greater than 15

## Program Variables

Dynamic Logic $=$ Typed FOL $+\ldots$

$$
i>5 \rightarrow[i=i+10 ;] i>15
$$

Program variable i refers to different values before and after execution

- Program variables such as i are state-dependent constant symbols
- Value of state-dependent symbols changeable by a program

## Program Variables

Dynamic Logic $=$ Typed FOL $+\ldots$

$$
i>5 \rightarrow[i=i+10 ;] i>15
$$

Program variable i refers to different values before and after execution

- Program variables such as i are state-dependent constant symbols
- Value of state-dependent symbols changeable by a program

Three words one meaning: state-dependent, non-rigid, flexible

## Rigid versus Flexible Symbols

Signature of program logic defined as in FOL, but in addition, there are program variables

Rigid versus Flexible

- Rigid symbols, meaning insensitive to program states
- First-order variables (aka logical variables)
- Built-in functions and predicates such as $0,1, \ldots,+, *, \ldots,<, \ldots$
- Non-rigid (or flexible) symbols, meaning depends on state. Capture side effects on state during program execution
- Program variables are flexible

Any term containing at least one flexible symbol is called flexible

## Signature of Dynamic Logic

> Definition (Dynamic Logic Signature)
> $\Sigma=\left(P_{\Sigma}, F_{\Sigma}, P V_{\Sigma}, \alpha_{\Sigma}\right)$,
> $F_{\Sigma} \cap P V_{\Sigma}=\emptyset$
> (Rigid) Predicate Symbols
> $\begin{array}{ll}\text { (Rigid) Function Symbols } & F_{\Sigma}=\{>,>=, \ldots\} \\ \text { Non-rigid Program variables } & \text { e.g. } P V_{\Sigma}=\{, *, 0,1, \ldots\} \\ \text { N }, \text { ready }, \ldots\}\end{array}$

Standard typing of JAVA symbols: boolean TRUE; <(int,int);

## Dynamic Logic Signature - KeY input file

```
\sorts {
    // only additional sorts (int, boolean, any predefined)
}
\functions {
    // only additional rigid functions
    // (arithmetic functions like +,- etc., predefined)
}
\predicates { /* same as for functions */ }
```

Empty sections can be left out

## Dynamic Logic Signature - KeY input file

```
\sorts {
    // only additional sorts (int, boolean, any predefined)
}
\functions {
    // only additional rigid functions
    // (arithmetic functions like +,- etc., predefined)
}
\predicates { /* same as for functions */ }
\programVariables { // non-rigid
        int i, j;
        boolean ready;
}
```

Empty sections can be left out

## Again: Two Kinds of Variables

Rigid:
Definition (First-Order/Logical Variables)
Typed logical variables (rigid), declared locally in quantifiers as $\mathrm{T} x$;
They may not occur in programs!

Non-rigid:

## Program Variables

- Are not FO variables
- Cannot be quantified
- May occur in programs (and formulas)

## Dynamic Logic Programs

Dynamic Logic $=$ Typed FOL + programs $\ldots$
Programs here: any legal sequence of JAVA statements.

## Dynamic Logic Programs

Dynamic Logic $=$ Typed FOL + programs $\ldots$
Programs here: any legal sequence of JaVA statements.

## Example

Signature for $\mathrm{FSym}_{f}$ : int r ; int i ; int n ;
Signature for $\mathrm{FSym}_{r}$ : int 0 ; int +(int,int); int -(int,int);
Signature for $\mathrm{PSym}_{r}$ : < (int, int);

```
\[
i=0
\]
\[
r=0 ;
\]
\[
\text { while }(i<n) \quad\{
\]
\[
i=i+1
\]
\[
r=r+i
\]
\[
\}
\]
\[
r=r+r-n
\]
```

## Dynamic Logic Programs

Dynamic Logic $=$ Typed FOL + programs $\ldots$
Programs here: any legal sequence of Java statements.

## Example

Signature for $\mathrm{FSym}_{f}$ : int r ; int i ; int n ;
Signature for $\mathrm{FSym}_{r}$ : int 0 ; int +(int,int); int -(int,int);
Signature for $\mathrm{PSym}_{r}$ : < (int, int);

```
i=0;
r=0;
while (i<n) {
    i=i+1;
    r=r+i;
}
r=r+r-n;
```

Which value does the program compute in $r$ ?

## Relating Program States: Modalities

DL extends FOL with two additional (mix-fix) operators:

- $\langle\mathrm{p}\rangle \phi$ (diamond)
- $[p] \phi$ (box)
with p a program, $\phi$ another DL formula

## Relating Program States: Modalities

DL extends FOL with two additional (mix-fix) operators:

- $\langle\mathrm{p}\rangle \phi$ (diamond)
- $[p] \phi$ (box)
with p a program, $\phi$ another DL formula
Intuitive Meaning
- $\langle\mathrm{p}\rangle \phi: \mathrm{p}$ terminates and formula $\phi$ holds in final state (total correctness)

## Relating Program States: Modalities

DL extends FOL with two additional (mix-fix) operators:

- $\langle\mathrm{p}\rangle \phi$ (diamond)
- $[p] \phi$ (box)
with p a program, $\phi$ another DL formula
Intuitive Meaning
- $\langle\mathrm{p}\rangle \phi: \mathrm{p}$ terminates and formula $\phi$ holds in final state (total correctness)
- [p] $\phi$ : If p terminates then formula $\phi$ holds in final state (partial correctness)

## Relating Program States: Modalities

DL extends FOL with two additional (mix-fix) operators:

- $\langle\mathrm{p}\rangle \phi$ (diamond)
- $[p] \phi$ (box)
with p a program, $\phi$ another DL formula
Intuitive Meaning
- $\langle\mathrm{p}\rangle \phi: \mathrm{p}$ terminates and formula $\phi$ holds in final state (total correctness)
- [p] $\phi$ : If p terminates then formula $\phi$ holds in final state (partial correctness)

Attention: JaVA programs are deterministic, i.e., if a JaVA program terminates then exactly one state is reached from a given initial state.

## Dynamic Logic - Examples

Let i, j, old_i, old_j denote program variables.
Give the meaning in natural language:

1. $i=o l d \_i \rightarrow\langle i=i+1 ;\rangle i>o l d \_i$

## Dynamic Logic - Examples

Let i, j, old_i, old_j denote program variables.
Give the meaning in natural language:

1. $i=o l d \_i \rightarrow\langle i=i+1 ;\rangle i>o l d \_i$

If $i=i+1$; is executed in a state where $i$ and old_i have the same value, then the program terminates and in its final state the value of $i$ is greater than the value of old_i .

## Dynamic Logic - Examples

Let i, j, old_i, old_j denote program variables.
Give the meaning in natural language:

1. $i=o l d \_i \rightarrow\langle i=i+1 ;\rangle i>o l d \_i$

If $i=i+1$; is executed in a state where $i$ and old_ $i$ have the same value, then the program terminates and in its final state the value of $i$ is greater than the value of old_i.
2. $i=o l d \_i \rightarrow\left[\right.$ while(true) $\left.\left\{i=o l d \_i-1 ;\right\}\right] i>o l d \_i$

## Dynamic Logic - Examples

Let i, j, old_i, old_j denote program variables.
Give the meaning in natural language:

1. $i=o l d \_i \rightarrow\langle i=i+1 ;\rangle i>o l d \_i$

If $i=i+1$; is executed in a state where $i$ and old_ $i$ have the same value, then the program terminates and in its final state the value of $i$ is greater than the value of old_i .
2. $i=o l d \_i \rightarrow\left[\right.$ while (true) $\left.\left\{i=o l d \_i-1 ;\right\}\right] i>o l d \_i$

If the program is executed in a state where i and old_i have the same value and if the program terminates then in its final state the value of $i$ is greater than the value of old_i.

## Dynamic Logic - Examples

Let i, j, old_i, old_j denote program variables.
Give the meaning in natural language:

1. $i=o l d \_i \rightarrow\langle i=i+1 ;\rangle i>o l d \_i$

If $i=i+1$; is executed in a state where $i$ and old_ $i$ have the same value, then the program terminates and in its final state the value of $i$ is greater than the value of old_i .
2. $i=o l d \_i \rightarrow\left[\right.$ while (true) $\left.\left\{i=o l d \_i-1 ;\right\}\right] i>o l d \_i$

If the program is executed in a state where i and old_i have the same value and if the program terminates then in its final state the value of $i$ is greater than the value of old_i.
3. $\forall x .\left(\left\langle\operatorname{prog}_{1}\right\rangle \mathrm{i}=x \leftrightarrow\left\langle\operatorname{prog}_{2}\right\rangle \mathrm{i}=x\right)$

## Dynamic Logic - Examples

Let i, j, old_i, old_j denote program variables.
Give the meaning in natural language:

1. $i=o l d \_i \rightarrow\langle i=i+1 ;\rangle i>o l d \_i$

If $i=i+1$; is executed in a state where $i$ and old_i have the same value, then the program terminates and in its final state the value of $i$ is greater than the value of old_i .
2. $i=o l d \_i \rightarrow\left[\right.$ while (true) $\left.\left\{i=o l d \_i-1 ;\right\}\right] i>o l d \_i$

If the program is executed in a state where i and old_i have the same value and if the program terminates then in its final state the value of $i$ is greater than the value of old_i.
3. $\forall x .\left(\left\langle\operatorname{prog}_{1}\right\rangle \mathrm{i}=x \leftrightarrow\left\langle\operatorname{prog}_{2}\right\rangle \mathrm{i}=x\right)$
$\operatorname{prog}_{1}$ and $\operatorname{prog}_{2}$ are equivalent concerning termination and the final value of $i$.

## Dynamic Logic: KeY Input File

```
\programVariables { // Declares global program variables
    int i;
    int old_i;
}
```

## Dynamic Logic: KeY Input File

```
\programVariables { // Declares global program variables
    int i;
    int old_i;
}
```

\problem \{ // The problem to verify is stated here

$$
i=o l d \_i \quad->~ \<\{\quad i=i+1 ; \quad\} \backslash>i>o l d \_i
$$

\}

## Dynamic Logic: KeY Input File

```
\programVariables { // Declares global program variables
    int i;
    int old_i;
}
```

\problem \{ // The problem to verify is stated here

$$
\text { i = old_i -> } \backslash<\{\quad i=1+1 ; \quad\} \backslash>i>o l d \_i
$$

\}

## Visibility

- Program variables declared globally can be accessed anywhere
- Program variables declared inside a modality such as "pre $\rightarrow\langle$ int $j ; p\rangle$ post" only visible in $p$

## Dynamic Logic Formulas

## Definition (Dynamic Logic Formulas (DL Formulas))

- Each FOL formula is a DL formula
- If p is a program and $\phi$ a DL formula then $\left\{\begin{array}{c}\langle\mathrm{p}\rangle \phi \\ {[\mathrm{p}] \phi}\end{array}\right\}$ is a DL formula
- DL formulas closed under FOL quantifiers and connectives

## Dynamic Logic Formulas

## Definition (Dynamic Logic Formulas (DL Formulas))

- Each FOL formula is a DL formula
- If p is a program and $\phi$ a DL formula then $\left\{\begin{array}{c}\langle\mathrm{p}\rangle \phi \\ {[\mathrm{p}] \phi}\end{array}\right\}$ is a DL formula
- DL formulas closed under FOL quantifiers and connectives
- Program variables are flexible constants: never bound in quantifiers
- Program variables need not be declared or initialized in program
- Programs contain no logical variables
- Modalities can be arbitrarily nested, e.g., $\langle\mathrm{p}\rangle[\mathrm{q}] \phi$

## Dynamic Logic Formulas Cont'd

Example (Well-formed? If yes, under which signature?)
$-\forall$ int $y ;((\langle\mathrm{x}=2 ;\rangle \mathrm{x}=y) \leftrightarrow(\langle\mathrm{x}=1 ; \mathrm{x}++;\rangle \mathrm{x}=y))$

## Dynamic Logic Formulas Cont'd

Example (Well-formed? If yes, under which signature?)
$-\forall \operatorname{int} y ;((\langle\mathrm{x}=2 ;\rangle \mathrm{x}=y) \leftrightarrow(\langle\mathrm{x}=1 ; \mathrm{x}++;\rangle \mathrm{x}=y))$
Well-formed if $\mathrm{FSym}_{f}$ contains int x ;

## Dynamic Logic Formulas Cont'd

Example (Well-formed? If yes, under which signature?)

- $\forall$ int $y ;((\langle\mathrm{x}=2 ;\rangle \mathrm{x}=y) \leftrightarrow(\langle\mathrm{x}=1 ; \mathrm{x}++;\rangle \mathrm{x}=y))$

Well-formed if $\mathrm{FSym}_{f}$ contains int x ;

- $\exists$ int $x ;[x=1 ;](x=1)$

## Dynamic Logic Formulas Cont'd

Example (Well-formed? If yes, under which signature?)

- $\forall$ int $y ;((\langle\mathrm{x}=2 ;\rangle \mathrm{x}=y) \leftrightarrow(\langle\mathrm{x}=1 ; \mathrm{x}++;\rangle \mathrm{x}=y))$

Well-formed if $\mathrm{FSym}_{f}$ contains int x ;

- $\exists$ int $x ;[x=1 ;](x=1)$

Not well-formed, because logical variable occurs in program

## Dynamic Logic Formulas Cont'd

Example (Well-formed? If yes, under which signature?)
$-\forall$ int $y ;((\langle\mathrm{x}=2 ;\rangle \mathrm{x}=y) \leftrightarrow(\langle\mathrm{x}=1 ; \mathrm{x}++;\rangle \mathrm{x}=y))$
Well-formed if $\mathrm{FSym}_{f}$ contains int x ;

- $\exists$ int $x ;[x=1 ;](x=1)$

Not well-formed, because logical variable occurs in program

- $\langle\mathrm{x}=1$; $\rangle([$ while (true) $\}]$ false $)$

## Dynamic Logic Formulas Cont'd

Example (Well-formed? If yes, under which signature?)

- $\forall$ int $y ;((\langle\mathrm{x}=2 ;\rangle \mathrm{x}=y) \leftrightarrow(\langle\mathrm{x}=1 ; \mathrm{x}++;\rangle \mathrm{x}=y))$

Well-formed if $\mathrm{FSym}_{f}$ contains int x ;

- $\exists$ int $x ;[x=1 ;](x=1)$

Not well-formed, because logical variable occurs in program

- $\langle\mathrm{x}=1 ;\rangle([$ while (true) $\}]$ false $)$

Well-formed if $P V_{\Sigma}$ contains int $x$; program formulas can be nested

## Dynamic Logic Semantics: States

First-order state can be considered as program state

- Interpretation of (non-rigid) program variables can vary from state to state
- Interpretation of rigid symbols is the same in all states
(e.g., built-in functions and predicates)

## Program states as first-order states

We identify first-order state $\mathcal{S}=(\mathcal{D}, \delta, \mathcal{I})$ with program state.

- Interpretation $\mathcal{I}$ only changes on program variables.
$\Rightarrow$ only record values of variables $\in P V_{\Sigma}$
- Set of all states $\mathcal{S}$ is called States

## Kripke Structure

## Definition (Kripke Structure)

Kripke structure or Labelled transition system $K=($ States, $\rho$ )

- States $\mathcal{S}=(\mathcal{D}, \delta, \mathcal{I}) \in$ States
- Transition relation $\rho:$ Program $\rightarrow($ States $\rightharpoonup$ States $)$

$$
\begin{gathered}
\rho(\mathrm{p})\left(\mathcal{S}_{1}\right)=\mathcal{S}_{2} \\
\text { iff. }
\end{gathered}
$$

program p executed in state $\mathcal{S}_{1}$ terminates and its final state is $\mathcal{S}_{2}$, otherwise undefined.

- $\rho$ is the semantics of programs $\in$ Program
- $\rho(\mathrm{p})(\mathcal{S})$ can be undefined (' ${ }^{\prime}$ '):
p may not terminate when started in $\mathcal{S}$
- Our programs are deterministic (unlike Promela): $\rho(\mathrm{p})$ is a function (at most one value)

## Semantic Evaluation of Program Formulas

Definition (Validity Relation for Program Formulas)

- $\mathcal{S} \models\langle\mathrm{p}\rangle \phi \quad$ iff $\quad \rho(\mathrm{p})(\mathcal{S})$ is defined and $\rho(\mathrm{p})(\mathcal{S}) \models \phi$
( $p$ terminates and $\phi$ is true in the final state after execution)

## Semantic Evaluation of Program Formulas

Definition (Validity Relation for Program Formulas)

- $\mathcal{S} \models\langle\mathrm{p}\rangle \phi \quad$ iff $\quad \rho(\mathrm{p})(\mathcal{S})$ is defined and $\rho(\mathrm{p})(\mathcal{S}) \models \phi$
( p terminates and $\phi$ is true in the final state after execution)
- $\boldsymbol{s} \vDash[\mathrm{p}] \phi \quad$ iff $\rho(\mathrm{p})(\mathcal{S}) \models \phi$ whenever $\rho(\mathrm{p})(\mathcal{S})$ is defined
(If p terminates then $\phi$ is true in the final state after execution)

## Semantic Evaluation of Program Formulas

Definition (Validity Relation for Program Formulas)

- $\mathcal{S} \models\langle\mathrm{p}\rangle \phi \quad$ iff $\quad \rho(\mathrm{p})(\mathcal{S})$ is defined and $\rho(\mathrm{p})(\mathcal{S}) \models \phi$
( p terminates and $\phi$ is true in the final state after execution)
- $s \models[\mathrm{p}] \phi \quad$ iff $\rho(\mathrm{p})(\mathcal{S}) \models \phi$ whenever $\rho(\mathrm{p})(\mathcal{S})$ is defined
(If p terminates then $\phi$ is true in the final state after execution)
A DL formula $\phi$ is valid iff $\mathcal{S} \models \phi$ for all states $\mathcal{S}$.

## Semantic Evaluation of Program Formulas

## Definition (Validity Relation for Program Formulas)

- $\mathcal{S} \models\langle\mathrm{p}\rangle \phi \quad$ iff $\quad \rho(\mathrm{p})(\mathcal{S})$ is defined and $\rho(\mathrm{p})(\mathcal{S}) \models \phi$
( p terminates and $\phi$ is true in the final state after execution)
- $s \models[\mathrm{p}] \phi \quad$ iff $\rho(\mathrm{p})(\mathcal{S}) \models \phi$ whenever $\rho(\mathrm{p})(\mathcal{S})$ is defined
(If p terminates then $\phi$ is true in the final state after execution)
A DL formula $\phi$ is valid iff $\mathcal{S} \models \phi$ for all states $\mathcal{S}$.
- Duality: $\langle\mathrm{p}\rangle \phi$ iff $\neg[\mathrm{p}] \neg \phi$

Exercise: justify this with help of semantic definitions

- Implication: if $\langle\mathrm{p}\rangle \phi$ then $[\mathrm{p}] \phi$

Total correctness implies partial correctness

- converse is false
- holds only for deterministic programs

## More Examples

valid?<br>meaning?

## Example

$\forall \tau y ;((\langle\mathrm{p}\rangle \mathrm{x}=y) \leftrightarrow(\langle\mathrm{q}\rangle \mathrm{x}=y))$

## More Examples

$$
\begin{aligned}
& \text { valid? } \\
& \text { meaning? } \\
& \text { Example } \\
& \forall \tau y ;((\langle p\rangle x=y) \leftrightarrow(\langle q\rangle x=y))
\end{aligned}
$$

Not valid in general
Programs p and q behave equivalently on variable $\tau \mathrm{x}$

## More Examples

```
valid?
meaning?
```

## Example

```
\(\forall \tau y ;((\langle\mathrm{p}\rangle \mathrm{x}=y) \leftrightarrow(\langle\mathrm{q}\rangle \mathrm{x}=y))\)
```

Not valid in general
Programs p and q behave equivalently on variable $\tau \mathrm{x}$

## Example <br> $\exists \tau y ;(\mathrm{x}=y \rightarrow\langle\mathrm{p}\rangle$ true $)$

## More Examples

## valid?

meaning?

## Example

$\forall \tau y ;((\langle\mathrm{p}\rangle \mathrm{x}=y) \leftrightarrow(\langle\mathrm{q}\rangle \mathrm{x}=y))$
Not valid in general
Programs p and q behave equivalently on variable $\tau \mathrm{x}$

## Example

$\exists \tau y ;(\mathrm{x}=y \rightarrow\langle\mathrm{p}\rangle$ true $)$
Not valid in general
Program $p$ terminates if initial value of $x$ is suitably chosen

## Semantics of Programs

In labelled transition system $K=($ States, $\rho)$ :
$\rho:$ Program $\rightarrow($ States $\rightharpoonup$ States $)$ is semantics of programs $\mathrm{p} \in$ Program
$\rho$ defined recursively on programs

## Semantics of Programs

In labelled transition system $K=($ States, $\rho)$ :
$\rho:$ Program $\rightarrow($ States $\rightharpoonup$ States $)$ is semantics of programs $\mathrm{p} \in$ Program

## $\rho$ defined recursively on programs

## Example (Semantics of assignment)

States $\mathcal{S}$ interpret program variables v with $\mathcal{I}_{\mathcal{S}}(\mathrm{v})$
$\rho(\mathrm{x}=\mathrm{t} ;)(\mathcal{S})=\mathcal{S}^{\prime}$ where $\mathcal{S}^{\prime}$ identical to $\mathcal{S}$ except $\mathcal{I}_{\mathcal{S}^{\prime}}(x)=$ val $I_{\mathcal{S}}(t)$

## Semantics of Programs

In labelled transition system $K=($ States, $\rho)$ :
$\rho:$ Program $\rightarrow($ States $\rightharpoonup$ States $)$ is semantics of programs $\mathrm{p} \in$ Program

## $\rho$ defined recursively on programs

## Example (Semantics of assignment)

States $\mathcal{S}$ interpret program variables v with $\mathcal{I}_{\mathcal{S}}(\mathrm{v})$
$\rho(\mathrm{x}=\mathrm{t} ;)(\mathcal{S})=\mathcal{S}^{\prime}$ where $\mathcal{S}^{\prime}$ identical to $\mathcal{S}$ except $\mathcal{I}_{\mathcal{S}^{\prime}}(x)=$ val $\mathcal{S}_{\mathcal{S}}(t)$

Very advanced task to define $\rho$ for JAVA $\Rightarrow$ Not done in this course Next lecture, we go directly to calculus for program formulas!

## Literature for this Lecture

- W. Ahrendt, Using KeY Chapter 10 in [KeYbook]
- up-to-date alternative:
W. Ahrendt, S. Grebing Using the KeY Prover to appear in the new KeY Book (see Google group)
- Dynamic Logic (Sections 3.1, 3.2, 3.4, 3.5, 3.6.1, 3.6.3, 3.6.4), Chapter 3 in [KeYbook]
