

# Intersection Testing

## Chapter 16

Department of Computer  
Engineering  
Chalmers University of  
Technology

# Tutorial 7

Two options:

- Default:

- 3D World + 3DSMax Design tutorial:
  - Your own render engine

or

- Optionally:

- Path tracing lab
  - The most recent way to implement path tracing.
    - Autodesk's way

# What for?

- A tool needed for the graphics people all the time...
- Very important components:
  - Need to make them fast!
- Finding if (and where) a ray hits an object
  - Picking
  - Ray tracing and global illumination
- For speed-up techniques
- Collision detection (treated in a later lecture)

# Example

Midtown Madness 3, DICE

# Some basic geometrical primitives

- Ray:

- Sphere:

- Box

- Axis-aligned (AABB)

- Oriented (OBB)

- $k$ -DOP

# Four different techniques

- Analytical
  - Geometrical
  - Separating axis theorem (SAT)
  - Dynamic tests
- 
- Given these, one can derive many tests quite easily
    - However, often tricks are needed to make them fast

# Analytical: Ray/sphere test

- Sphere center:  $\mathbf{c}$ , and radius  $r$
- Ray:  $\mathbf{r}(t) = \mathbf{o} + t\mathbf{d}$
- Sphere formula:  $\|\mathbf{p} - \mathbf{c}\| = r$
- Replace  $\mathbf{p}$  by  $\mathbf{r}(t)$ , and square it:

$$(\mathbf{r}(t) - \mathbf{c}) \cdot (\mathbf{r}(t) - \mathbf{c}) - r^2 = 0$$

$$(\mathbf{o} + t\mathbf{d} - \mathbf{c}) \cdot (\mathbf{o} + t\mathbf{d} - \mathbf{c}) - r^2 = 0$$

$$(t\mathbf{d} + (\mathbf{o} - \mathbf{c})) \cdot (t\mathbf{d} + (\mathbf{o} - \mathbf{c})) - r^2 = 0$$

$$(\mathbf{d} \cdot \mathbf{d})t^2 + 2((\mathbf{o} - \mathbf{c}) \cdot \mathbf{d})t + (\mathbf{o} - \mathbf{c}) \cdot (\mathbf{o} - \mathbf{c}) - r^2 = 0$$

$$t^2 + 2((\mathbf{o} - \mathbf{c}) \cdot \mathbf{d})t + (\mathbf{o} - \mathbf{c}) \cdot (\mathbf{o} - \mathbf{c}) - r^2 = 0 \quad \|\mathbf{d}\| = 1$$

# Analytical, continued

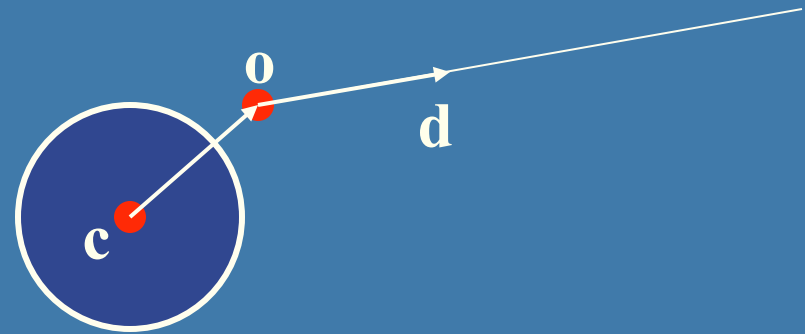

$$t^2 + 2((\mathbf{o} - \mathbf{c}) \cdot \mathbf{d})t + (\mathbf{o} - \mathbf{c}) \cdot (\mathbf{o} - \mathbf{c}) - r^2 = 0$$

- Be a little smart...

$$(\mathbf{o} - \mathbf{c}) \cdot \mathbf{d} > 0 ?$$

$$(\mathbf{o} - \mathbf{c}) \cdot (\mathbf{o} - \mathbf{c}) - r^2 < 0 ?$$

- Such tests are called "rejection tests"

- Other shapes:  $p_x^2 + p_y^2 = r^2$

$$(p_x / a)^2 + (p_y / b)^2 + (p_z / c)^2 = 1$$

$$(p_x / a)^2 + (p_y / b)^2 - p_z = 0$$

# Geometrical: Ray/Box Intersection

- Boxes and spheres often used as bounding volumes
- A slab is the volume between two parallel planes:
- A box is the logical intersection of three slabs (2 in 2D):

# Geometrical: Ray/Box Intersection (2)

- Intersect the 2 planes of each slab with the ray

- Keep max of  $t^{\min}$  and min of  $t^{\max}$
- If  $t^{\min} < t^{\max}$  then we got an intersection
- Special case when ray parallel to slab

# Separating Axis Theorem (SAT)

## Page 563 in book

- Two convex polyhedrons, A and B, are disjoint if any of the following axes separate the objects:
  - An axis orthogonal to a face of A
  - An axis orthogonal to a face of B
  - An axis formed from the cross product of one edge from each of A and B

# SAT example: Triangle/Box

- E.g an axis-aligned box and a triangle
- 1) test the axes that are orthogonal to the faces of the box
- That is,  $x$ ,  $y$ , and  $z$

## Triangle/Box with SAT (2)

- Assume that they overlapped on x,y,z
- Must continue testing
- 2) Axis orthogonal to face of triangle

# Triangle/Box with SAT (3)

- If still no separating axis has been found...
- **3) Test axis:  $t = e_{\text{box}} \times e_{\text{triangle}}$**
- Example:
  - x-axis from box:  $e_{\text{box}} = (1, 0, 0)$
  - $e_{\text{triangle}} = v_1 - v_0$
- Test all such combinations
- If there is at least one separating axis, then the objects do not collide
- Else they do overlap

# Rules of Thumb for Intersection Testing

- Acceptance and rejection test
  - Try them early on to make a fast exit
- Postpone expensive calculations if possible
- Use dimension reduction
  - E.g. 3 one-dimensional tests instead of one complex 3D test, or 2D instead of 3D
- Share computations between objects if possible
- Timing!

# Another analytical example: Ray/ Triangle in detail

- Ray:  $\mathbf{r}(t) = \mathbf{o} + t\mathbf{d}$
- Triangle vertices:  $\mathbf{v}_0, \mathbf{v}_1, \mathbf{v}_2$
- A point in the triangle:
- $\mathbf{t}(u, v) = \mathbf{v}_0 + u(\mathbf{v}_1 - \mathbf{v}_0) + v(\mathbf{v}_2 - \mathbf{v}_0) =$   
 $= (1 - u - v)\mathbf{v}_0 + u\mathbf{v}_1 + v\mathbf{v}_2 \quad [u, v \geq 0, u + v \leq 1]$
- Set  $\mathbf{t}(u, v) = \mathbf{r}(t)$ , and solve!

$$\begin{pmatrix} | & | & | \\ -\mathbf{d} & \mathbf{v}_1 - \mathbf{v}_0 & \mathbf{v}_2 - \mathbf{v}_0 \\ | & | & | \end{pmatrix} \begin{pmatrix} t \\ u \\ v \end{pmatrix} = \begin{pmatrix} | \\ \mathbf{o} - \mathbf{v}_0 \\ | \end{pmatrix}$$

# Ray/Triangle (2)

$$\begin{pmatrix} | & | & | \\ -\mathbf{d} & \mathbf{v}_1 - \mathbf{v}_0 & \mathbf{v}_2 - \mathbf{v}_0 \\ | & | & | \end{pmatrix} \begin{pmatrix} t \\ u \\ v \end{pmatrix} = \begin{pmatrix} | & | \\ \mathbf{o} - \mathbf{v}_0 \\ | & | \end{pmatrix}$$

$$\mathbf{e}_1 = \mathbf{v}_1 - \mathbf{v}_0 \quad \mathbf{e}_2 = \mathbf{v}_2 - \mathbf{v}_0 \quad \mathbf{s} = \mathbf{o} - \mathbf{v}_0$$

- Solve with Cramer's rule:

$$\begin{pmatrix} | & | & | \\ -\mathbf{d} & \mathbf{e}_1 & \mathbf{e}_2 \\ | & | & | \end{pmatrix} \begin{pmatrix} t \\ u \\ v \end{pmatrix} = \begin{pmatrix} | \\ \mathbf{s} \\ | \end{pmatrix}$$

$$\begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} j \\ k \\ l \end{bmatrix}$$

$$Ax = b$$

$$x = \frac{\begin{vmatrix} j & b & c \\ k & e & f \\ l & h & i \end{vmatrix}}{\begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix}}, \quad y = \frac{\begin{vmatrix} a & j & c \\ d & k & f \\ g & l & i \end{vmatrix}}{\begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix}}, \quad \text{and } z = \frac{\begin{vmatrix} a & b & j \\ d & e & k \\ g & h & l \end{vmatrix}}{\begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix}}$$

$$\begin{pmatrix} t \\ u \\ v \end{pmatrix} = \frac{1}{\det(-\mathbf{d}, \mathbf{e}_1, \mathbf{e}_2)} \begin{pmatrix} \det(\mathbf{s}, \mathbf{e}_1, \mathbf{e}_2) \\ \det(-\mathbf{d}, \mathbf{s}, \mathbf{e}_2) \\ \det(-\mathbf{d}, \mathbf{e}_1, \mathbf{s}) \end{pmatrix}$$

## Ray/Triangle (2)

$$\begin{pmatrix} | & | & | \\ -\mathbf{d} & \mathbf{v}_1 - \mathbf{v}_0 & \mathbf{v}_2 - \mathbf{v}_0 \\ | & | & | \end{pmatrix} \begin{pmatrix} t \\ u \\ v \end{pmatrix} = \begin{pmatrix} | & | \\ \mathbf{o} - \mathbf{v}_0 \\ | & | \end{pmatrix}$$

$$\mathbf{e}_1 = \mathbf{v}_1 - \mathbf{v}_0 \quad \mathbf{e}_2 = \mathbf{v}_2 - \mathbf{v}_0 \quad \mathbf{s} = \mathbf{o} - \mathbf{v}_0$$

- Solve with Cramer's rule:

$$\begin{pmatrix} t \\ u \\ v \end{pmatrix} = \frac{1}{\det(-\mathbf{d}, \mathbf{e}_1, \mathbf{e}_2)} \begin{pmatrix} \det(\mathbf{s}, \mathbf{e}_1, \mathbf{e}_2) \\ \det(-\mathbf{d}, \mathbf{s}, \mathbf{e}_2) \\ \det(-\mathbf{d}, \mathbf{e}_1, \mathbf{s}) \end{pmatrix}$$

$$\begin{pmatrix} | & | & | \\ -\mathbf{d} & \mathbf{e}_1 & \mathbf{e}_2 \\ | & | & | \end{pmatrix} \begin{pmatrix} t \\ u \\ v \end{pmatrix} = \begin{pmatrix} | \\ \mathbf{s} \\ | \end{pmatrix}$$

Use this fact:  $\det(\mathbf{a}, \mathbf{b}, \mathbf{c}) = (\mathbf{a} \times \mathbf{b}) \cdot \mathbf{c} = -(\mathbf{a} \times \mathbf{c}) \cdot \mathbf{b}$

$$\begin{pmatrix} t \\ u \\ v \end{pmatrix} = \frac{1}{(\mathbf{d} \times \mathbf{e}_2) \cdot \mathbf{e}_1} \begin{pmatrix} (\mathbf{s} \times \mathbf{e}_1) \cdot \mathbf{e}_2 \\ (\mathbf{d} \times \mathbf{e}_2) \cdot \mathbf{s} \\ (\mathbf{s} \times \mathbf{e}_1) \cdot \mathbf{d} \end{pmatrix}$$

- Share factors to speed up computations

# Ray/Triangle (3) Implementation

$$\begin{pmatrix} t \\ u \\ v \end{pmatrix} = \frac{1}{(\mathbf{d} \times \mathbf{e}_2) \cdot \mathbf{e}_1} \begin{pmatrix} (\mathbf{s} \times \mathbf{e}_1) \cdot \mathbf{e}_2 \\ (\mathbf{d} \times \mathbf{e}_2) \cdot \mathbf{s} \\ (\mathbf{s} \times \mathbf{e}_1) \cdot \mathbf{d} \end{pmatrix}$$

- Be smart!
  - Compute as little as possible. Then test
- Examples:  $\mathbf{p} = \mathbf{d} \times \mathbf{e}_2$   
 $a = \mathbf{p} \cdot \mathbf{e}_1$   
 $f = 1/a$
- Compute  $u = f(\mathbf{p} \cdot \mathbf{s})$
- Then test valid bounds
- `if (u < 0 or u > 1) exit;`

$$\text{Plane : } \pi : \mathbf{n} \cdot \mathbf{p} + d = 0$$

# Point/Plane

- Insert a point  $\mathbf{x}$  into plane equation:

$$f(\mathbf{x}) = \mathbf{n} \cdot \mathbf{x} + d$$

$$f(\mathbf{x}) = \mathbf{n} \cdot \mathbf{x} + d = 0 \quad \text{for } \mathbf{x}'\text{s on the plane}$$

$$f(\mathbf{x}) = \mathbf{n} \cdot \mathbf{x} + d < 0 \quad \text{for } \mathbf{x}'\text{s on one side of the plane}$$

$$f(\mathbf{x}) = \mathbf{n} \cdot \mathbf{x} + d > 0 \quad \text{for } \mathbf{x}'\text{s on the other side}$$

Negative  
half space

Positive  
half space

# Sphere/Plane Box/Plane

$$\text{Plane: } \pi : \mathbf{n} \cdot \mathbf{p} + d = 0$$

$$\text{Sphere: } \mathbf{c} \quad r$$

$$\text{AABB: } \mathbf{b}^{\min} \quad \mathbf{b}^{\max}$$

- Sphere: compute  $f(\mathbf{c}) = \mathbf{n} \cdot \mathbf{c} + d$
- $f(\mathbf{c})$  is the signed distance ( $\mathbf{n}$  normalized)
- $\text{abs}(f(\mathbf{c})) > r$  no collision
- $\text{abs}(f(\mathbf{c})) = r$  sphere touches the plane
- $\text{abs}(f(\mathbf{c})) < r$  sphere intersects plane
- Box: insert all 8 corners
- If all  $f$ 's have the same sign, then all points are on the same side, and no collision

# AABB/plane

$$\text{Plane : } \pi : \mathbf{n} \cdot \mathbf{p} + d = 0$$
$$\text{Sphere : } \mathbf{c} \quad r$$
$$\text{Box : } \mathbf{b}^{\min} \quad \mathbf{b}^{\max}$$

- The smart way (shown in 2D)
- Find the two vertices that have the most positive and most negative value when tested against the plane

$$\mathbf{v}_{pos_x} = (\mathbf{n}_x > 0) ? \mathbf{b}_{max_x} : \mathbf{b}_{min_x}$$

$$\mathbf{v}_{pos_y} = (\mathbf{n}_y > 0) ? \mathbf{b}_{max_y} : \mathbf{b}_{min_y}$$

$$\mathbf{v}_{pos_z} = (\mathbf{n}_z > 0) ? \mathbf{b}_{max_z} : \mathbf{b}_{min_z}$$

$$\mathbf{v}_{neg_x} = (\mathbf{n}_x < 0) ? \mathbf{b}_{max_x} : \mathbf{b}_{min_x}$$

$$\mathbf{v}_{neg_y} = (\mathbf{n}_y < 0) ? \mathbf{b}_{max_y} : \mathbf{b}_{min_y}$$

$$\mathbf{v}_{neg_z} = (\mathbf{n}_z < 0) ? \mathbf{b}_{max_z} : \mathbf{b}_{min_z}$$

OBB almost as easy. Just first project  $\mathbf{n}$  on OBB's axes – see p: 757

# Ray/Polygon: very briefly

- Intersect ray with polygon plane
- Project from 3D to 2D
- How?
- Find  $\max(|n_x|, |n_y|, |n_z|)$
- Skip that coordinate!
- Then, count crossing in 2D

# Volume/Volume tests

- Used in collision detection

- Sphere/sphere

- Compute squared distance between sphere centers, and compare to  $(r_1+r_2)^2$

- Axis-Aligned Bounding Box (AABB)

- Test in 1D for x,y, and z

- Oriented Bounding boxes

- Use SAT [details in book]

If:

any of object A's  $(x,y,z)_{\min}$  are larger than object B's  $(x,y,z)_{\max}$

or

any of object B's  $(x,y,z)_{\min}$  are larger than object A's  $(x,y,z)_{\max}$ ,

then there is no intersection.

Otherwise there is.

# View frustum testing

- View frustum is 6 planes:
- Near, far, right, left, top,
- Create planes from projection matrix
  - Let all positive half spaces be outside frustum
  - Not dealt with here -- p. 773-774, 3rd ed.
- Sphere/frustum common approach:
  - Test sphere against each of the 6 frustum planes:
    - If outside the plane => no intersection
    - If intersecting the plane or inside, continue
  - If not outside after all six planes, then conservatively consider sphere as inside or intersecting
- Example follows...

# View frustum testing example

- Not exact test, but not incorrect
  - A sphere that is reported to be inside, can be outside
  - Not vice versa
- Similarly for boxes

# Dynamic Intersection Testing

[In book: 620-628]

- Testing is often done every rendered frame, i.e., at discrete time intervals
- Therefore, you can get "quantum effects"

- Dynamic testing deals with this
- Is more expensive
- Deals with a time interval: time between two frames

# Dynamic intersection testing Sphere/Plane

- No collision occur:
  - If they are on the same side of the plane ( $s_c s_e > 0$ )
    - and:  $|s_c| > r$  and  $|s_e| > r$
- Otherwise, sphere can move  $|s_c| - r$
- Time of collision: 
$$t_{cd} = n + \frac{s_c - r}{s_c - s_e}$$
- Response: reflect  $\mathbf{v}$  around  $\mathbf{n}$ , and move  $(1 - t_{cd})\mathbf{r}$  ( $\mathbf{r}$ =refl vector)

# BONUS

## Dynamic Separating Axis Theorem

- SAT: tests one axis at a time for overlap

- Same with DSAT, but:
  - Use a relative system where B is fixed
    - i.e., compute A's relative motion to B.
  - Need to adjust A's projection on the axis so that the interval moves on the axis as well
- Need to test same axes as with SAT
- Same criteria for overlap/disjoint:
  - If no overlap on axis => disjoint
  - If overlap on all axes => objects overlap

**BONUS**

# Dynamic Sweep-and-Prune

- [http://graphics.idav.ucdavis.edu/~dcoming/papers/coming\\_staadt\\_vriphys05.pdf](http://graphics.idav.ucdavis.edu/~dcoming/papers/coming_staadt_vriphys05.pdf)

# Exercises

- Create a function (by writing code on paper) that tests for intersection between:
  - two spheres
  - a ray and a sphere
  - view frustum and a sphere

# Scan Line Fill

Set active edges to AB and AC

For  $y = A.y, A.y-1, \dots, C.y$

If  $y=B.y \rightarrow$  exchange AB with BC

Compute  $x_{start}$  and  $x_{end}$ .

Interpolate color, depth, texcoords  
etc for points  $(x_{start}, y)$  and  
 $(x_{end}, y)$

For  $x = x_{start}, x_{start}+1, \dots, x_{end}$

Compute color, depth etc for  
 $(x, y)$  using interpolation.

**This is one modern  
way to rasterize a  
triangle**

# Using Interpolation

$C_1$   $C_2$   $C_3$  specified by `glColor` or by vertex shading  
 $C_4$  determined by interpolating between  $C_1$  and  $C_3$   
 $C_5$  determined by interpolating between  $C_2$  and  $C_3$   
interpolate between  $C_4$  and  $C_5$  along span

# Rasterizing a Triangle

- Convex Polygons only
- Nonconvex polygons assumed to have been tessellated
- Shader results (e.g. colors) have been computed for the vertices. Depth occlusion resolved with z-buffer.
  - March across scan lines interpolating vertex shader output parameters, as input to the fragment shader.
  - Incremental work small

# Flood Fill

- Fill can be done recursively if we know a seed point located inside (WHITE)
- Scan convert edges into buffer in edge/inside color (BLACK)

```
flood_fill(int x, int y) {  
    if(read_pixel(x,y) == WHITE) {  
        write_pixel(x,y, BLACK);  
        flood_fill(x-1, y);  
        flood_fill(x+1, y);  
        flood_fill(x, y+1);  
        flood_fill(x, y-1);  
    }  
}
```

# What you need to know

- Analytic test:
  - Be able to compute ray vs sphere or other formula
  - ray vs triangle
- Geometrical tests
  - Ray/box with slab-test
  - Ray/polygon (3D->2D)
  - AABB/AABB
- Other:
  - Point/plane
  - Sphere/plane
  - Box/plane, AABB/plane
- SAT
- Know what a dynamic test is
- Understand floodfill
