#### **Texturing**

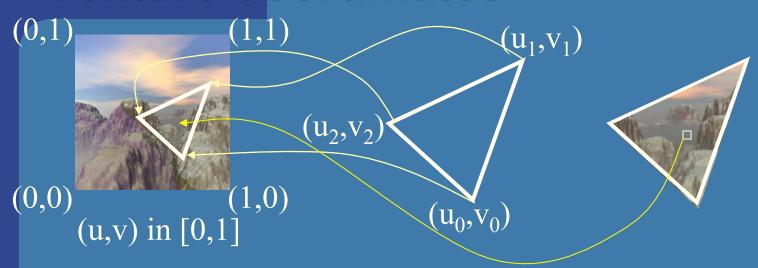

Slides done by Tomas Akenine-Möller and Ulf Assarsson
Department of Computer Engineering
Chalmers University of Technology

# Texturing: Glue n-dimensional images onto geometrical objects

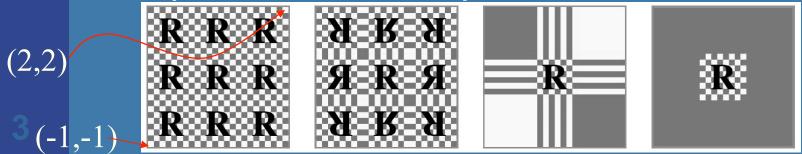

- Purpose: more realism, and this is a cheap way to do it
  - Bump mapping
  - Plus, we can do environment mapping
  - And other things

#### **Texture coordinates**

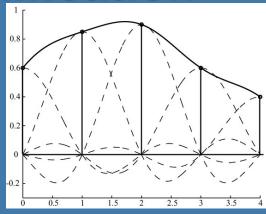

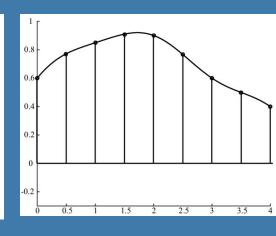

- What if (u,v) >1.0 or <0.0 ?</li>
- To repeat textures, use just the fractional part
   Example: 5.3 -> 0.3
- Repeat, mirror, clamp, border:

Texture magnification

What does the theory say...

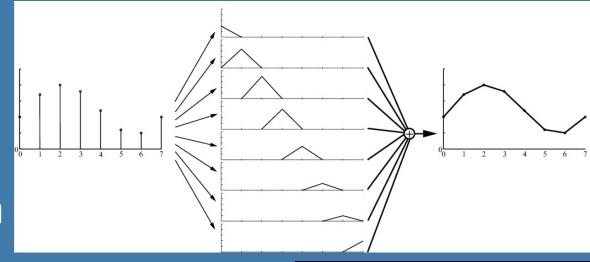

- sinc(x) is not feasible in real time
- Box filter (nearest-neighbor) is
- Poor quality

#### **Texture magnification**

- Tent filter is feasible!
- Linear interpolation

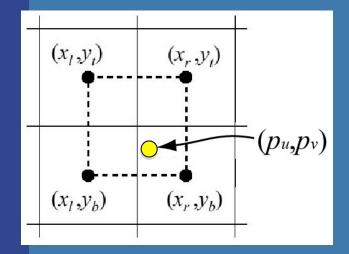

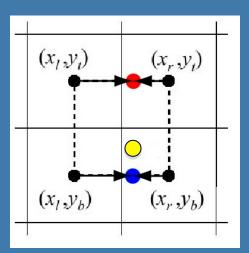

- Looks better
- Simple in 1D:
- (1-t)\*color0+t\*color1
- How about 2D?

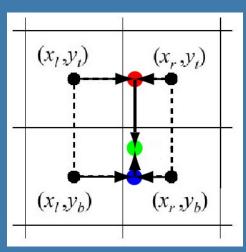

- Texture coordinates  $(p_u, p_v)$  in [0,1]
- Texture images size: n\*m texels
- Nearest neighbor would access: (floor(n\*u+0.5), floor(m\*v+0.5))
- Interpolate 1D in x & y respectively

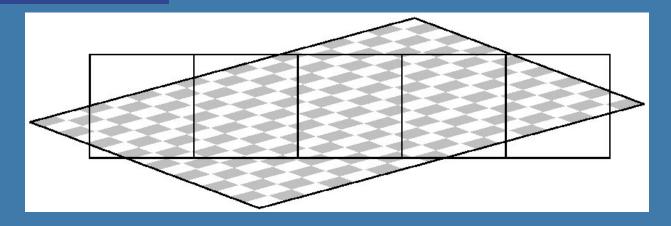

#### Bilinear interpolation

- Check out this formula at home
- t(u,v) accesses the texture map
- $\mathbf{b}(u,v)$  filtered texel
- (u',v') = fractional part of texel coordinate

$$(u',v') = (p_u - \lfloor p_u \rfloor, p_v - \lfloor p_v \rfloor).$$

$$\mathbf{b}(p_u, p_v) = (1 - u')(1 - v')\mathbf{t}(x_l, y_b) + u'(1 - v')\mathbf{t}(x_r, y_b) + (1 - u')v'\mathbf{t}(x_l, y_t) + u'v'\mathbf{t}(x_r, y_t).$$

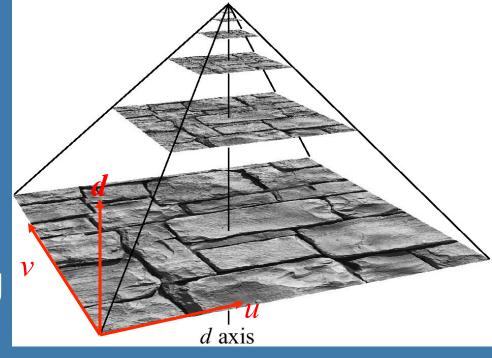

# Texture minification What does a pixel "see"?

- Theory (sinc) is too expensive
- Cheaper: average of texel inside a pixel
- Still too expensive, actually
- Mipmaps another level of approximation
  - Prefilter texture maps as shown on next slide

#### **Mipmapping**

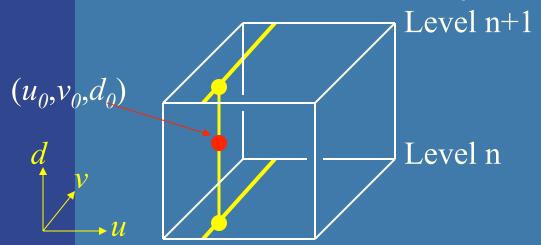

- Image pyramid
- Half width and height when going upwards

- Average over 4 "parent texels" to form "child texel"
- Depending on amount of minification, determine which image to fetch from
- Compute d first, gives two images
  - Bilinear interpolation in each

#### Mipmapping

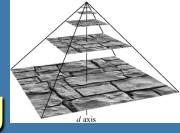

- Interpolate between those bilinear values
  - Gives trilinear interpolation

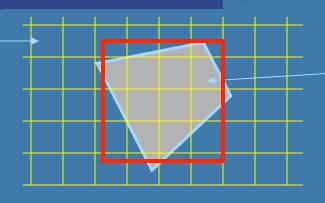

Constant time filtering: 8 texel accesses

• How to compute d?

texel

pixel projected to texture space

A = approximative area of quadrilateral

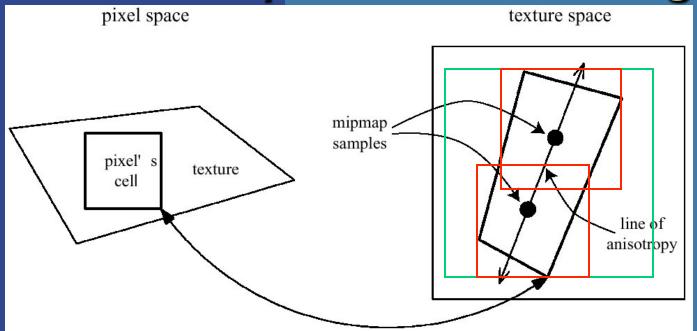

$$b = \sqrt{A}$$

$$d = \log_2 b$$

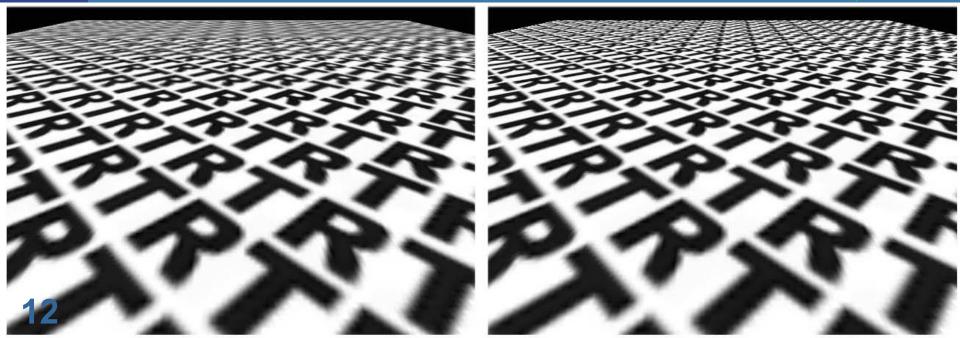

- Approximate quad with square
- Gives overblur!

- Even better: anisotropic texture filtering
  - Approximate quad with several smaller mipmap samples

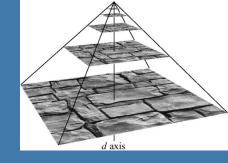

### Anisotropic texture filtering

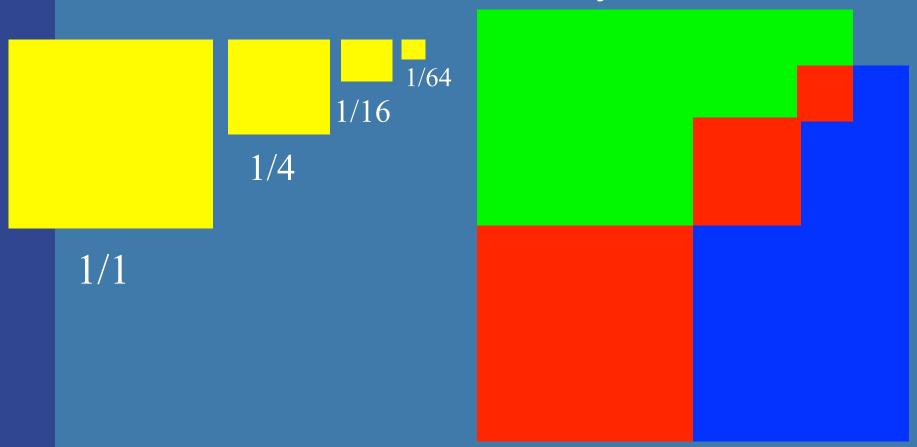

16 samples

#### Mipmapping: Memory requirements

Not twice the number of bytes…!

 Rather 33% more – not that much Modified by Ulf Assarsson 2004

#### **Miscellaneous**

- How to apply texturing:
  - Add, sub, etc as you like, using fragment shaders.

#### Common alternatives:

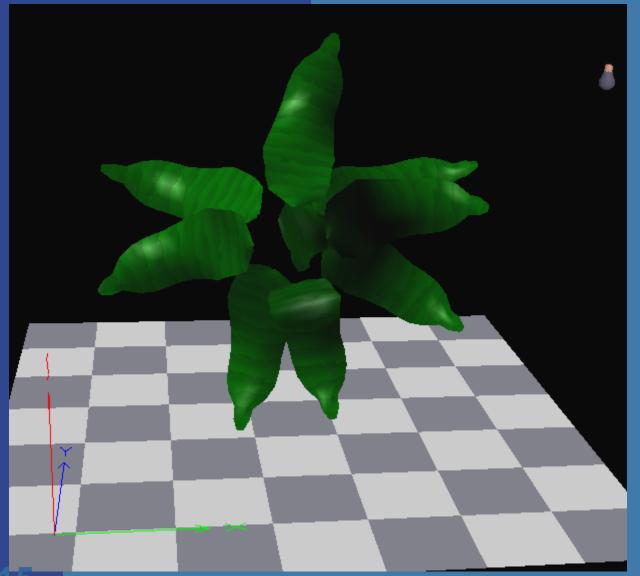

- Modulate (multiply texture with lighting)
- "Replace" (just use texture color)

#### Often:

diffuseTexture, (specularTexture, ambientTexture)

Instead of ambMtrl, diffMtrl, specMtrl

#### Modulate

Texture multiplied with result from lighting (amb, diff, spec)

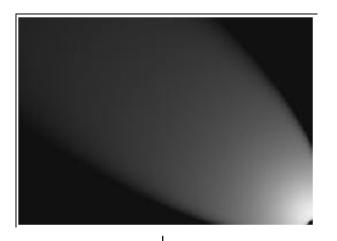

#### Using textures in OpenGL

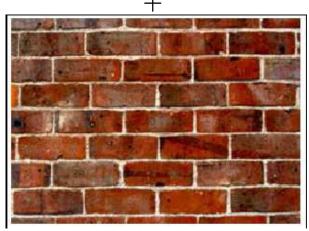

```
Do once when loading texture:
    glActiveTexture(GL_TEXTURE0);
    glGenTextures(1, &texture);
    glBindTexture(GL TEXTURE 2D, texture);
    int w, h, comp; // width, height, #components (rgb=3, rgba=4)
    unsigned char* image = stbi load("floor.jpg", &w, &h, &comp, STBI_rgb_alpha);
    glTexImage2D(GL TEXTURE 2D, 0, GL RGBA, w, h, 0, GL RGBA, GL UNSIGNED BYTE, image);
    free(image);
    glGenerateMipmap(GL TEXTURE 2D);
    //Indicates that the active texture should be repeated over the surface
    glTexParameteri(GL TEXTURE 2D, GL TEXTURE WRAP S, GL REPEAT);
    glTexParameteri(GL TEXTURE 2D, GL TEXTURE WRAP T, GL REPEAT);
    // Sets the type of mipmap interpolation to be used on magnifying and
    // minifying the active texture. These are the nicest available options.
    glTexParameteri(GL TEXTURE 2D, GL TEXTURE MAG FILTER, GL LINEAR);
    glTexParameteri(GL TEXTURE 2D, GL TEXTURE MIN FILTER, GL LINEAR MIPMAP LINEAR);
    glTexParameterf(GL TEXTURE 2D, GL TEXTURE MAX ANISOTROPY EXT, 16);
                                                                         FRAGMENT SHADER
Do every time you want to use this texture when drawing:
```

```
glActiveTexture(GL_TEXTURE0);
glBindTexture(GL_TEXTURE_2D, texture);
// Now, draw your triangles with texture coordinates specified
```

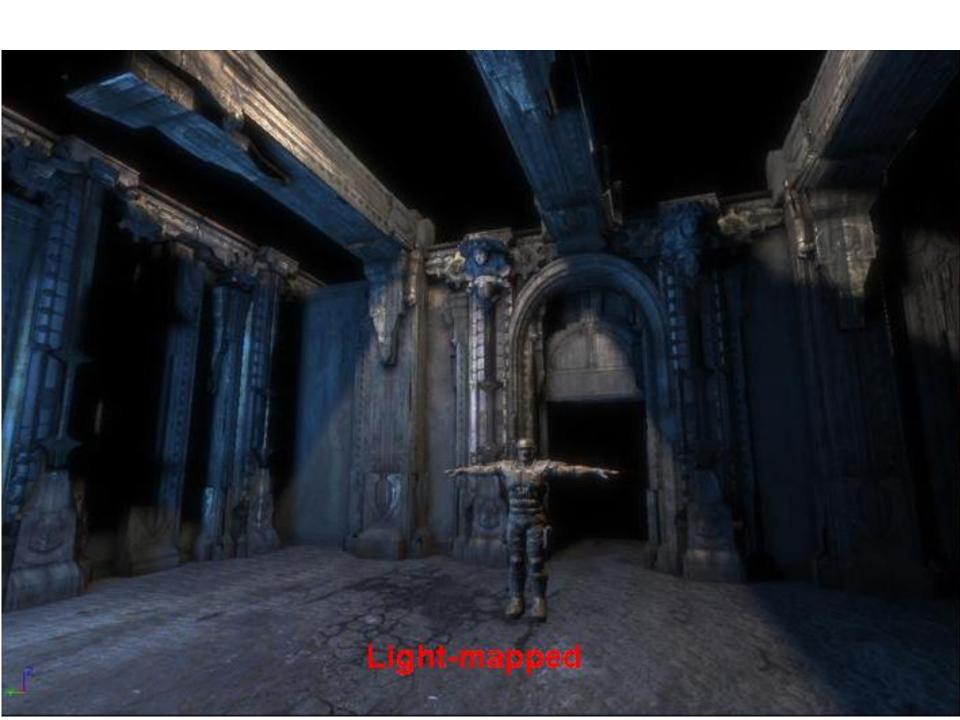

### Light Maps

- Often used in games
- Mutliply both textures with each other in the fragment shader, or (old way):
  - render wall using brick texture
  - render wall using light texture and blending to the frame buffer

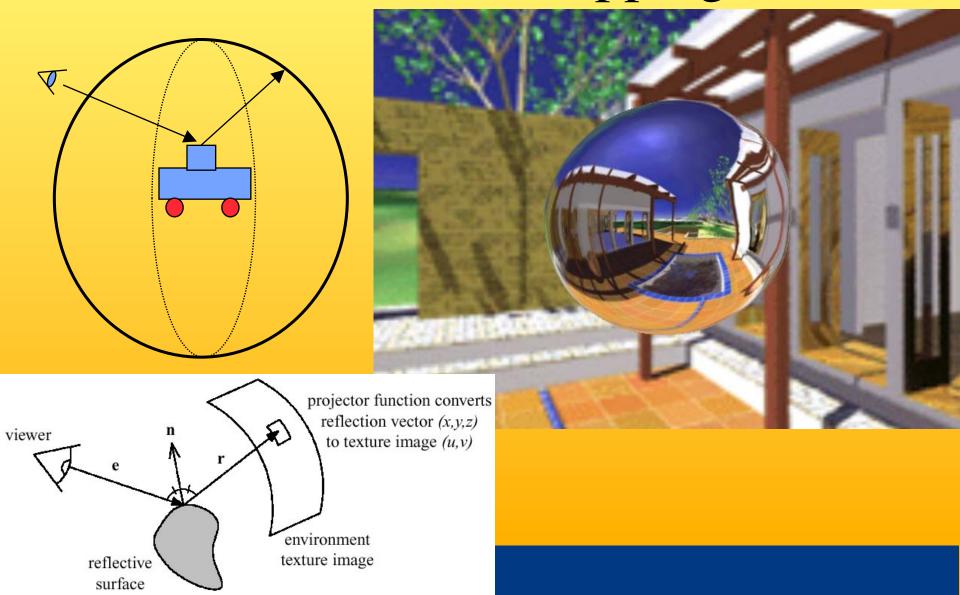

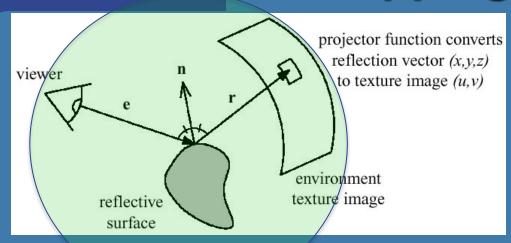

## Environment mapping

#### **Environment mapping**

- Assumes the environment is infinitely far away
- Sphere mapping
- Cube mapping is the norm nowadays
  - Advantages: no singularities as in sphere map
  - Much less distortion
  - Gives better result
  - Not dependent on a view position

### Sphere map

example

Sphere map (texture)

Sphere map applied on torus

#### Sphere Map

- Assume surface normals are available
- Then OpenGL can compute reflection vector at each pixel
- The texture coordinates s,t are given by:
  - (see OH 169 for details)

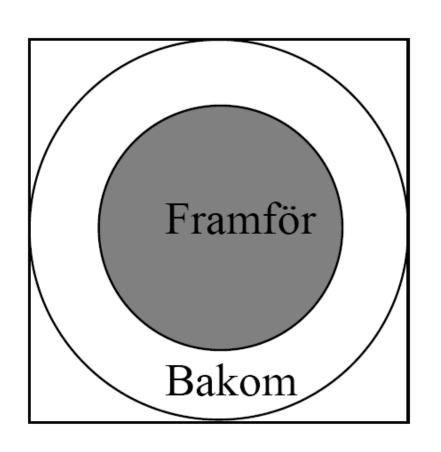

$$L = \sqrt{R_x^2 + R_y^2 + (R_z + 1)^2}$$

$$s = 0.5 \left(\frac{R_x}{L} + 1\right)$$

$$t = 0.5 \left(\frac{R_y}{L} + 1\right)$$

#### Sphere Map

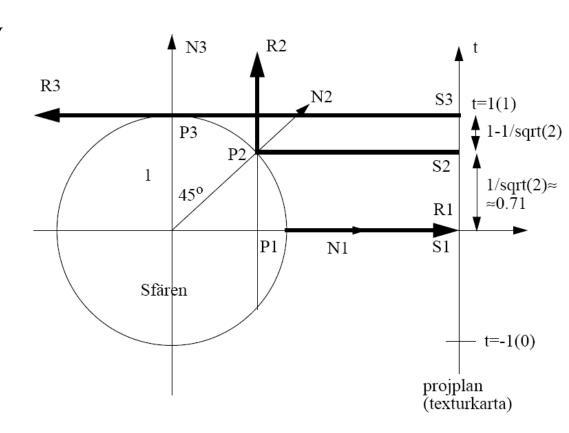

In front of the sphere. Behind the sphere.

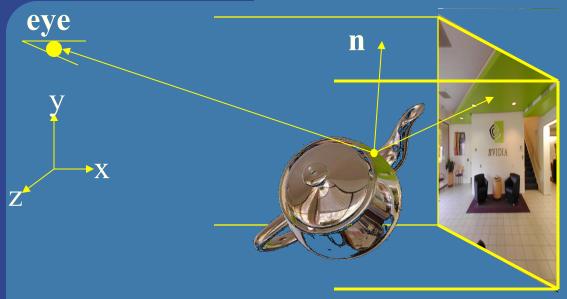

### Sphere Map

- Infinitesimally small reflective sphere (infinitely far away)
  - i.e., orthographic view of a reflective unit sphere
- Create by:
  - Photographing metal sphere
  - Or,
    - Ray tracing
    - Transforming cube map to sphere map

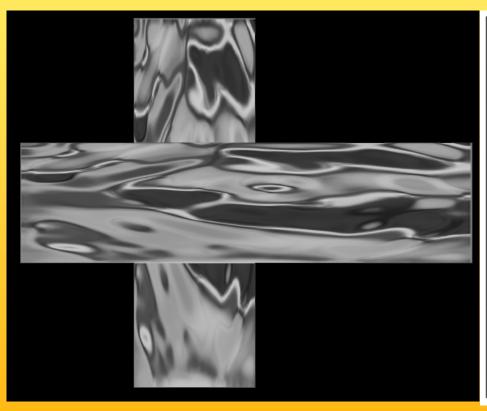

#### **Cube mapping**

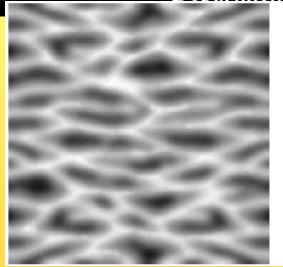

- Simple math: compute reflection vector, r
- Largest abs-value of component, determines which cube face.
  - Example: r=(5,-1,2) gives POS\_X face
- Divide  $\mathbf{r}$  by abs(5) gives (u,v)=(-1/5,2/5)
- Remap from [-1,1] to [0,1], i.e., ((u,v)+(1,1))/2
- Your hardware does all the work. You just have to compute the reflection vector. (See lab 4)

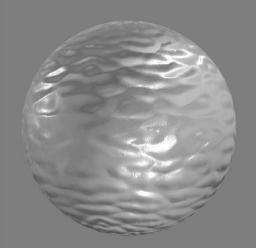

### Example

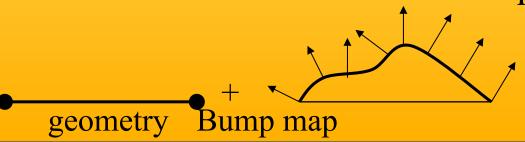

## Bump mapping

- by Blinn in 1978
- Inexpensive way of simulating wrinkles and bumps on geometry
  - Too expensive to model these geometrically
- Instead let a texture modify the normal at each pixel, and then use this normal to compute lighting

Bump mapped geometr

Stores heights: can derive normals

### Bump mapping

#### Storing bump maps:

- 1. as a gray scale image «
- 2. As  $\Delta x$ ,  $\Delta y$  distorsions
- 3. As normals  $(n_x, n_y, n_z) \leftarrow$

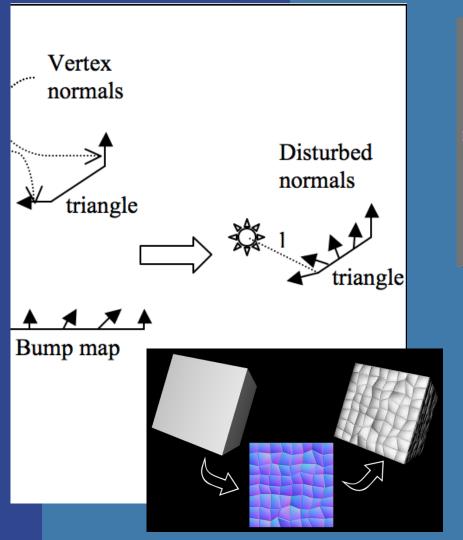

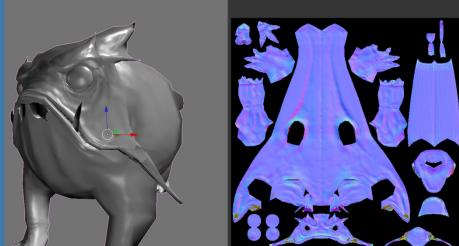

- $\mathbf{n} = (n_x, n_y, n_z)$  are in [-1,1]
- Add 1, mult 0.5: in [0,1]
- Mult by 255 (8 bit per color component)
  - Values can now be stored in 8-bit rgb texture

### Bump mapping: example

## Normal mapping in tangent space vs model space

Normal mapping – model space:

•Normals are stored directly in model space. I.e., as including both face orientation plus distorsion.

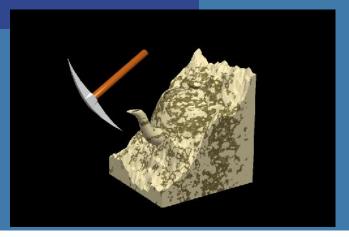

Bump mapping – tangent space:

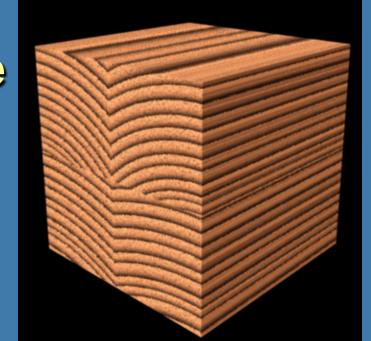

•Normals are stored as distorsion of face orientation. The same bump map can be tiled/repeated and reused for many faces with different orientation

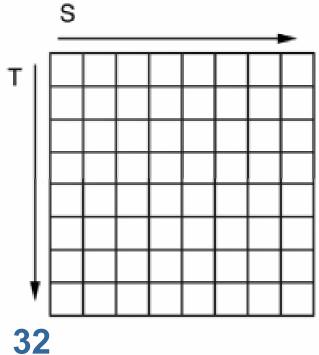

#### More...

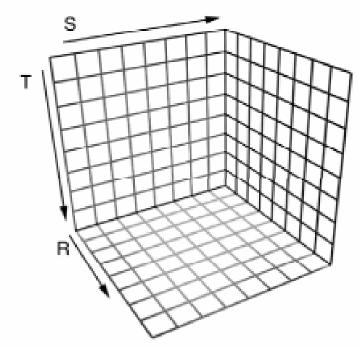

- 3D textures:
  - Texture filtering is no longer trilinear
  - Rather quadlinear (linear interpolation 4 times)
  - Enables new possibilities
    - Can store light in a room, for example
- Displacement Mapping
  - Offsets the position per pixel or per vertex
    - Offsetting per vertex is easy in vertex shader
    - Offsetting per pixel is architecturally hard
      - Cannot be done in fragment shader
      - Can be done using Geometry Shader (e.g. Direct3D 10) by ray casting in the displacement map

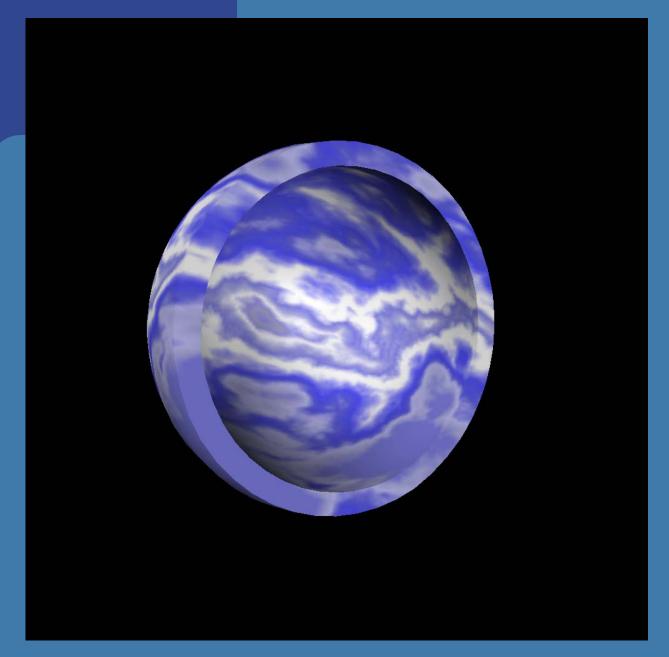

#### 2D texture vs 3D texture

From http://www.ati.com/developer/shaderx/ShaderX\_3DTextures.pdf

#### **Precomputed Light fields**

Max Payne 2 by Remedy Entertainment Samuli Laine and Janne Kontkanen

Displacement Mapping

 Uses a map to displace the surface at each position

Can be done with a Geometry Shader

Vertex Shader

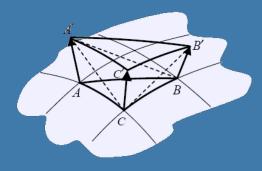

**Geometry Shader** 

Pixel Shader

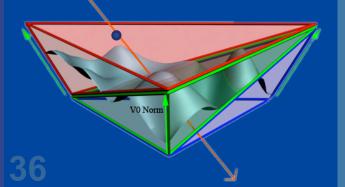

#### **Geometry Shader Example**

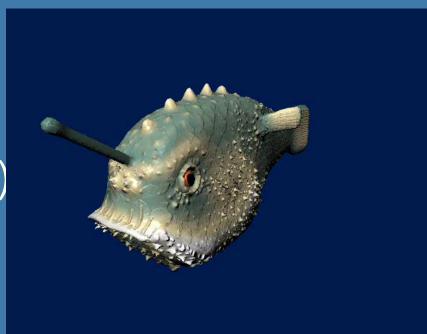

Generalized Displacement Maps

- Step 0: Process Vertices (VS)
- Step 1: Extrude Prisms (GS)

Step 2: Raytrace! (PS)

## Rendering to Texture

(See also Lab 5)

```
//**************
// Create a Frame Buffer Object (FBO) that we first render to and then use as a texture
//**************
glGenFramebuffers(1, &frameBuffer);
                                                                                                                                             // generate framebuffer id
glBindFramebuffer(GL FRAMEBUFFER, frameBuffer);
                                                                                                                                   // following commands will affect "frameBuffer"
// Create a texture for the frame buffer, with specified filtering, rgba-format and size
glGenTextures( 1, &texFrameBuffer );
glBindTexture( GL TEXTURE 2D, texFrameBuffer ); // following commands will affect "texFrameBuffer"
glTexParameteri( GL TEXTURE 2D, GL TEXTURE MIN FILTER, GL LINEAR );
glTexParameteri( GL_TEXTURE_2D, GL_TEXTURE_ MAG_FILTER, GL_LINEAR );
glTexImage2D(GL TEXTURE 2D, 0, 4, 512, 512, 0, GL RGBA, GL UNSIGNED BYTE, NULL);
// Create a depth buffer for our FBO
glGenRenderbuffers(1, &depthBuffer);
                                                                                                                               // get the ID to a new Renderbuffer
glBindRenderbuffer(GL RENDERBUFFER, depthBuffer);
glRenderbufferStorage(GL RENDERBUFFER, GL DEPTH COMPONENT, 512, 512);
// Set rendering of the default color0-buffer to go into the texture
glFramebufferTexture2D(GL FRAMEBUFFER, GL COLOR ATTACHMENT0, GL TEXTURE 2D,
                                                       texFrameBuffer, 0):
glFramebuffer (GL\_FRAMEBUFFER, GL\_DEPTH\_ATTACHMENT, GL\_RENDERBUFFER, GL_RENDERBUFFER, GL_RENDERBUFFE
depthBuffer); // Associate our created depth buffer with the FBO
```

Or simply render to back-buffer and copy into texture 37 using command: glCopyTexSubImage (). But is slower.

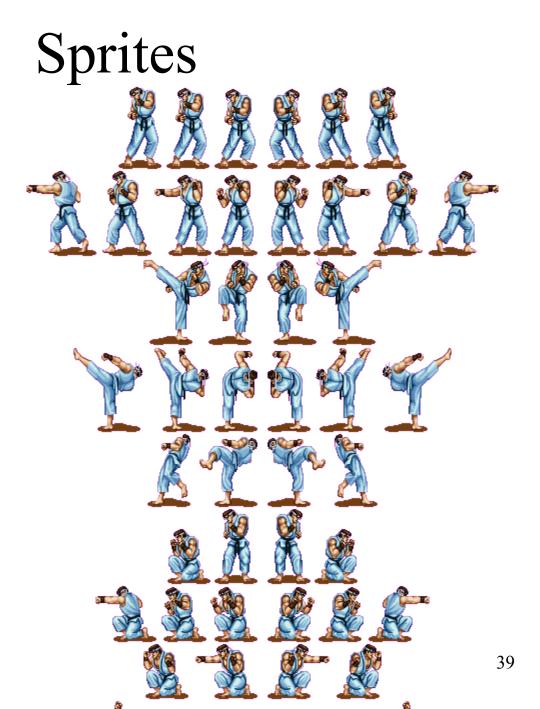

## **Sprites**

Sprites (=älvor) was a technique on older home computers, e.g. VIC64. As opposed to billboards sprites does not use the frame buffer. They are rasterized directly to the screen using a special chip. (A special bit-register also marked colliding sprites.)

```
GLbyte M[64]=
   127,0,0,127, 127,0,0,127,
   127,0,0,127, 127,0,0,127,
   0,127,0,0, 0,127,0,127, 0,127,0,1
   0,127,0,0,
   0,0,127,0, 0,0,127,127, 0,0,127,1
   0,0,127,0,
   127,127,0,0, 127,127,0,127,
   127,127,0,127, 127,127,0,0};
void display(void) {
   glClearColor(0.0,1.0,1.0,1.0);
   glClear(GL COLOR BUFFER BIT);
   glEnable (GL BLEND);
   glBlendFunc (GL SRC ALPHA,
        GL ONE MINUS SRC ALPHA);
   glRasterPos2d(xpos1,ypos1);
   glPixelZoom(8.0,8.0);
   glDrawPixels(width, height,
        GL RGBA, GL BYTE, M);
   qlPixelZoom(1.0,1.0);
   SDL GL SwapWindow //"Swap buffers"
```

**Animation Maps** 

The sprites for Ryu in Street Fighter:

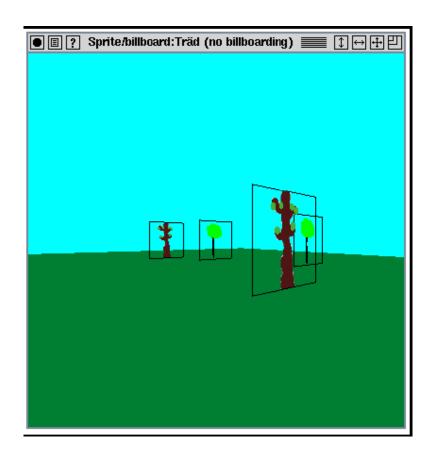

### Billboards

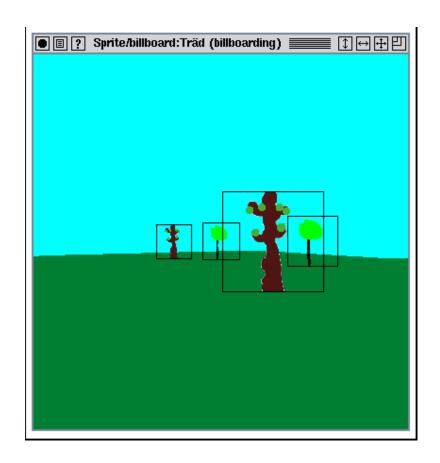

- 2D images used in 3D environments
  - Common for trees,explosions,clouds, lens-flares

### Billboards

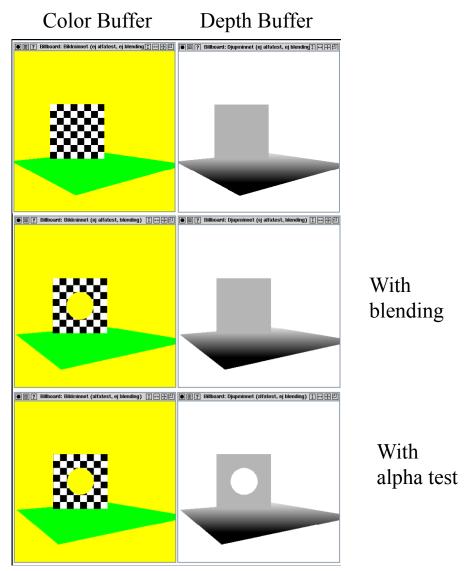

- Rotate them towards viewer
  - Either by rotation matrix (see OH 288), or
  - by orthographic projection

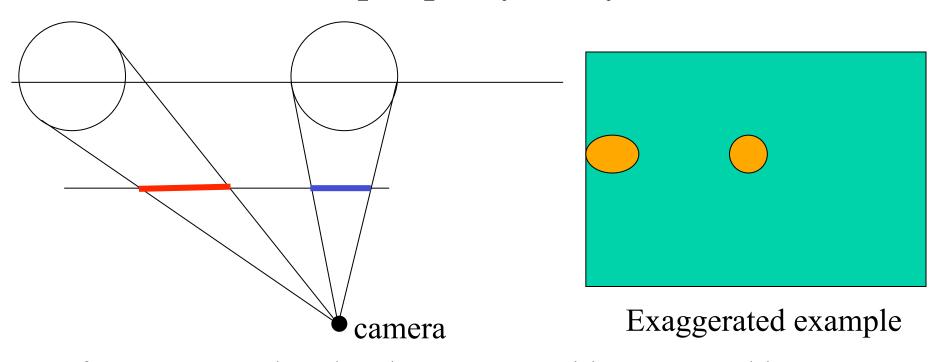

### Billboards

- Fix correct transparency by blending AND using alpha-test
  - In fragment shader:if (color.a < 0.1) discard;</li>
- Or: sort back-to-front and blend
  - (Depth writing could then be disabled to gain speed)
    - glDepthMask(0);

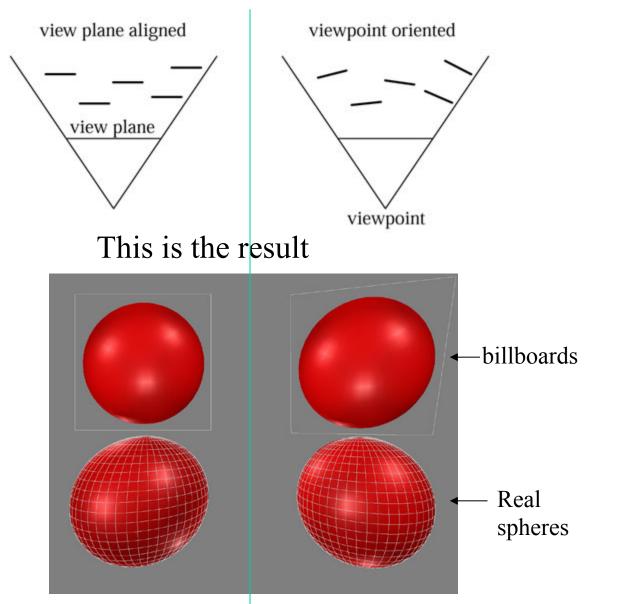

## Perspective distorsion

• Spheres often appear as ellipsoids when located in the periphery. Why?

If our eye was placed at the camera position, we would not see the distorsion. We are often positioned way behind the camera<sub>44</sub>

#### Which is preferred?

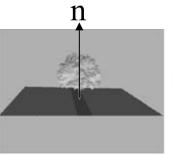

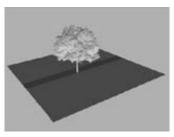

Actually, viewpoint oriented is often preferred since it most closely resembles the result using standard 3D geometry

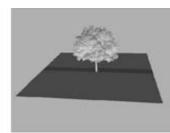

Also called *Impostors* 

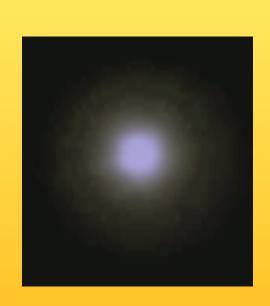

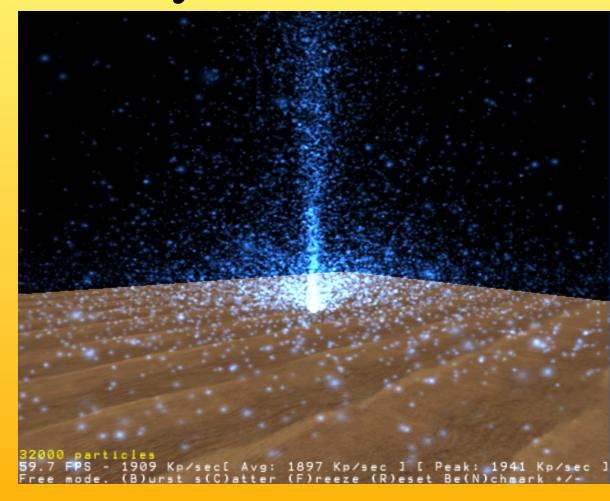

axial billboarding
The rotation axis is fixed and disregarding the view position

# Particle system

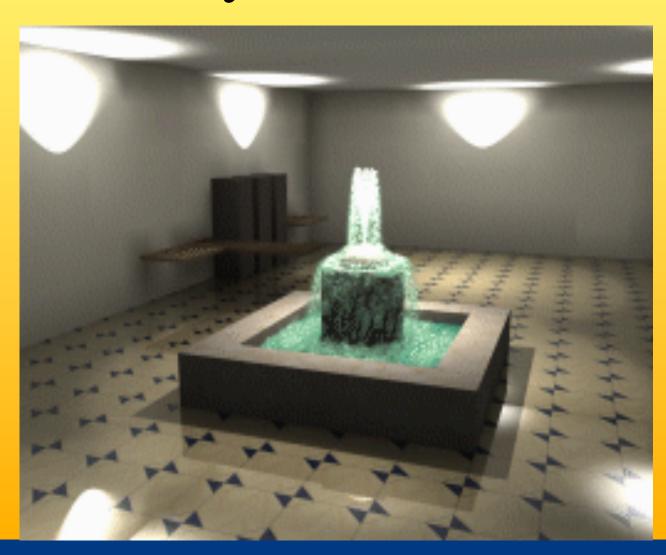

### **Particles**

# Partikelsystem

# Particle Systems

- Boids (flock of birds), see OH 230
  - 3 rules:
    - 1. Separation: Avoid obstacles and getting to close to each other
    - 2. Alignment (strive for same speed and direction as nearby boids
    - 3. Cohesion: steer towards center of mass of nearby boids
