

# Project: Hearizon: Explore through sound

---

Idea: In the modern world where you get bombarded by visual all the time, wouldn't it be nice to find out about your surroundings using only your ears? To listen in all directions, waiting for a sound that catches your interest? That is what "Hearizon" is about.

Description: Locations, Events and Sights can be tagged with a picture and a short soundclip. To explore what's going on the user moves his smartphone around. When the user points his phone in the direction of a tagged place he/she will hear the soundclip of that place. If the sound catches the users interest he/she can explore more about this place by clicking the "What's that" button to see a picture and some additional information.

The App can be used to tag sights, spots or current events, tagged and curated by the tourist office. Additional there can be a channel for user-generated content where users can tag interesting locations themselves with a picture and a sound for others to explore.
