 PRYSTINE

Variability is everywhere

Managing variability

Legend:

- Feature:
- Mandatory feature:
- Optional feature:
- Alternative features:
- Cross-tree constraints: $F_1 \rightarrow F_2$

Electric → Regenerative
Example feature model

ToyBox feature model with 71 features

30 years of feature-model research

Feature-oriented domain analysis (FODA) feasibility study

[KC Kang](#), [SG Cohen](#), [JA Hess](#), [WE Novak](#), [AS Peterson](#) - 1990 - apps.dtic.mil

Successful Software Engineering requires the automatic discovery and exploitation of

☆ [Cited by 4615](#) [Related articles](#) [All 12 versions](#) [↔](#)

Automated analysis of feature models 20 years later:

[D Benavides](#), [S Segura](#), [A Ruiz-Cortés](#) - Information systems, 2010 - Elsevier

☆ [Cited by 1151](#) [Related articles](#) [All 11 versions](#)

Refactoring

Quality assurance...

- As a step towards a feature-modeling methodology, we contribute:
 - **34 general feature-modeling principles organized into eight categories**
 - **Detailed discussion of each principle with guidelines for their use**

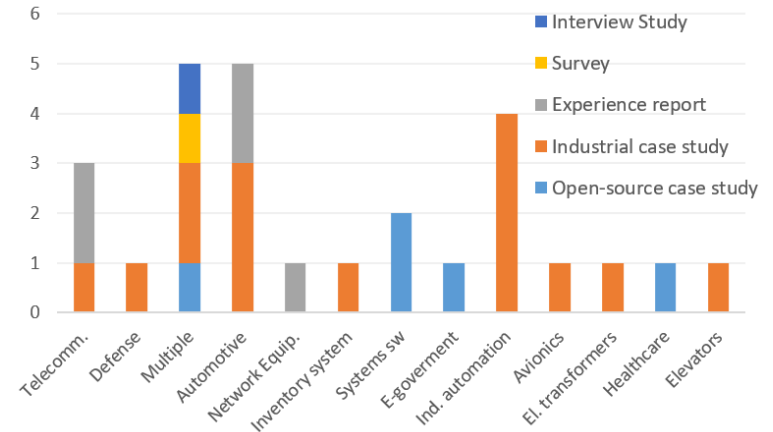

Literature sources

- Analyzed venues: ASE, ESEC/FSE, FOSD, ICSE, ICSME, ICSR, MODELS, SANER, SPLC, and VaMoS.
- Included empirical studies and experiences from practitioners, tool-vendors, educators

Methodology for the identification literature sources

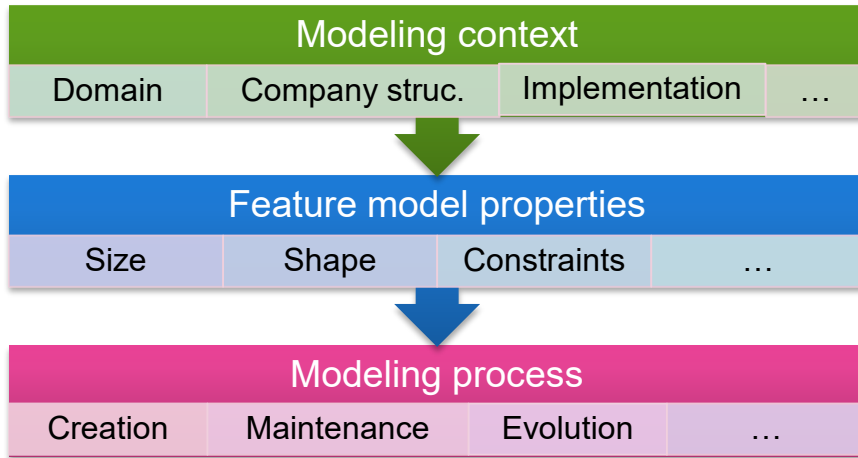

- Identified 31 paper across 26 years
- 11 different modeling notations
- 14 different application domains

Domains and types of identified papers

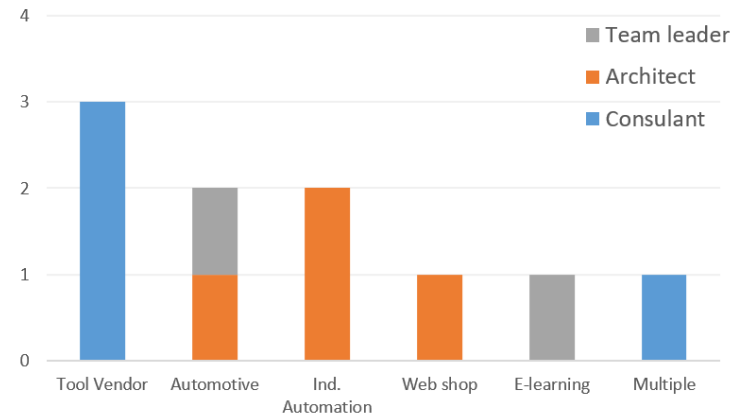

Interviews

- Semi-structured interviews (~1h)
- Included experienced practitioners, tool vendors, and consultants

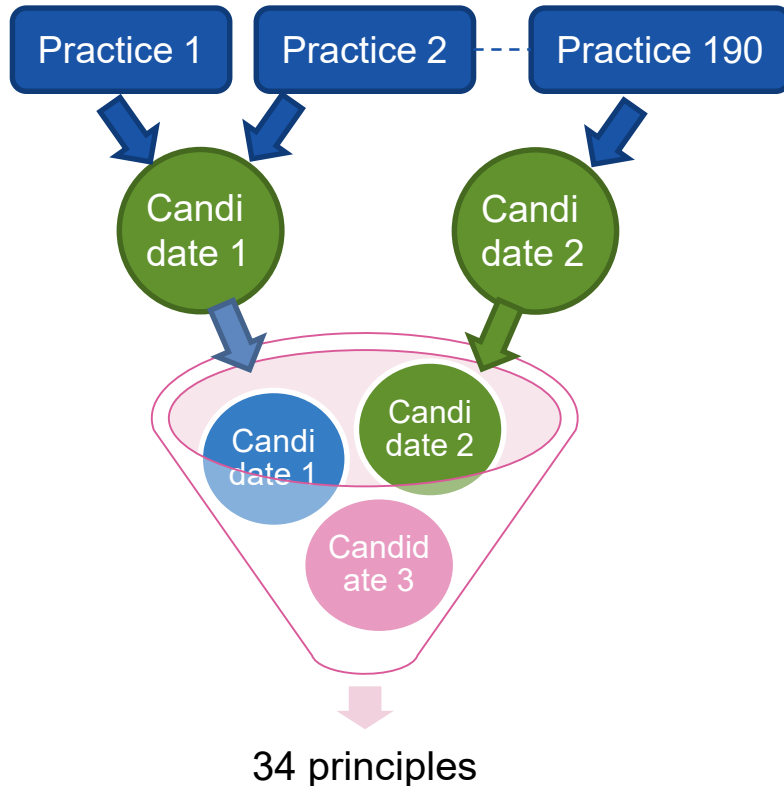

Interview guide

- 10 interviews from nine companies
- Company size 50 to 150.000 employees
- Feature model size 40 to >1000 features
- Implementation: C, C++, Java, model-based

Domains and roles of interviewees

Synthesizing the principles

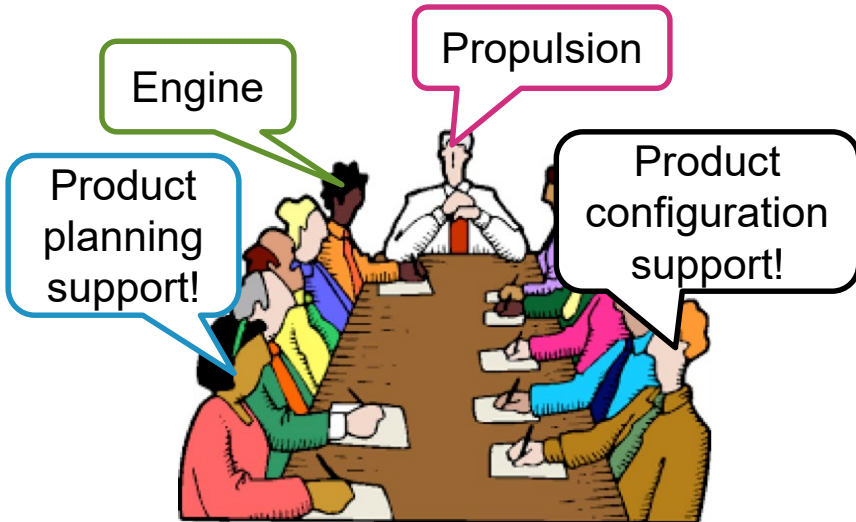

Category	# Principles
Planning and Preparation	6
Training	3
Information sources	1
Model Organization	5
Modeling	11
Dependencies	2
Quality Assurance	3
Model Maintenance and Evolution	3

How should we go about the creation of a feature model?

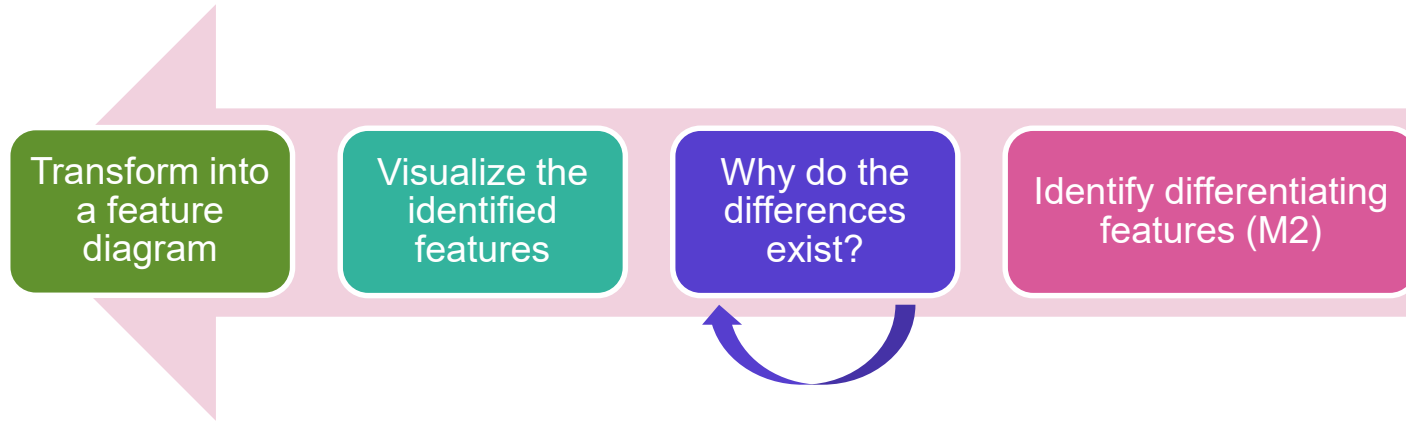

Planning and Preparation

- Identify relevant stakeholders (PP6)
 - Who are the modelers (keep the number low PP6)
 - Who are the users, maintainer
- Unify the domain terminology (PP2).
- Define the purpose of the feature model (PP3).
- Define feature to sub-feature decomposition criteria (PP4).
 - Functional, technical decomposition?

Training

- Conduct a pilot project (T3). (The “why, why, why” process)

I1: "...keep asking why until they come up from implementation level detail which is usually where they are thinking up until the essential features."

Information Sources and Modeling

```
- templateId: 'dialog-overview-example.html'
10 }
11 export class DialogOverviewExample {
12
13   constructor(public dialog: MDDialog) {}
14
15   ngOnInit() {
16     this.dialog.open(DialogOverviewExampleDialog);
17   }
18 }

Emission monitor

Battery management

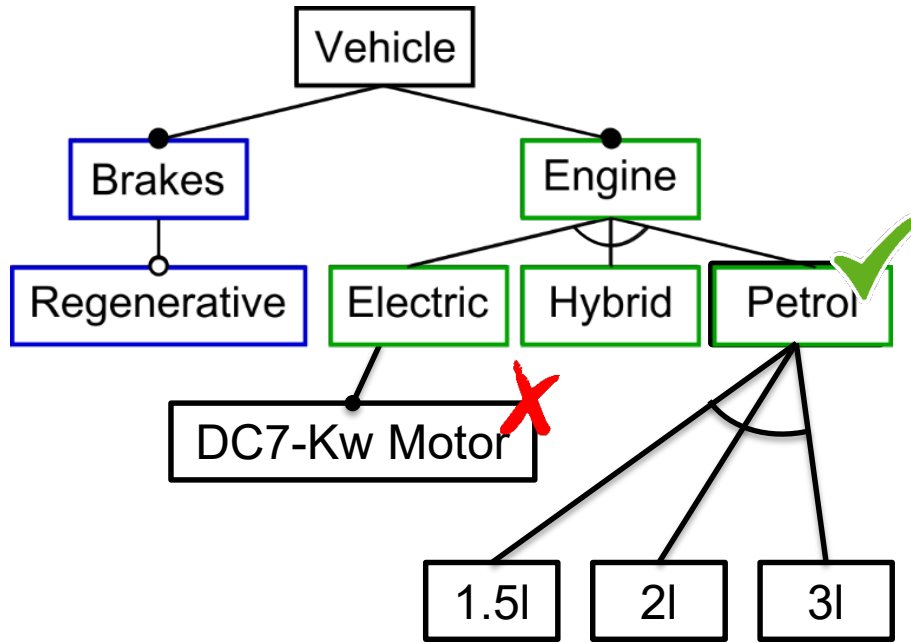

Petrol

Electric

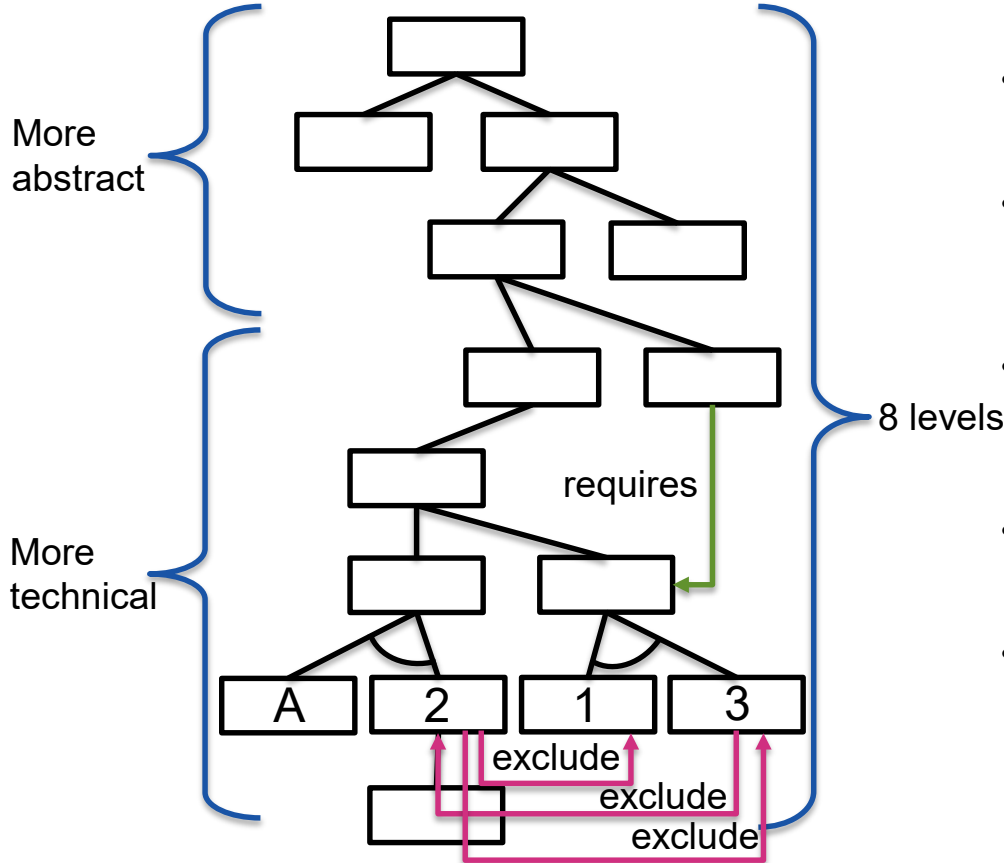

- Use domain knowledge from artifacts (IS1), in workshops with domain experts (M1).
- First identify distinguishing features (M2).
- Apply bottom-up modeling to artifacts (M3).
- Apply top-down modeling to the domain (M4).
- Apply bottom-up and top-down modeling (M5).

Modeling (continued)

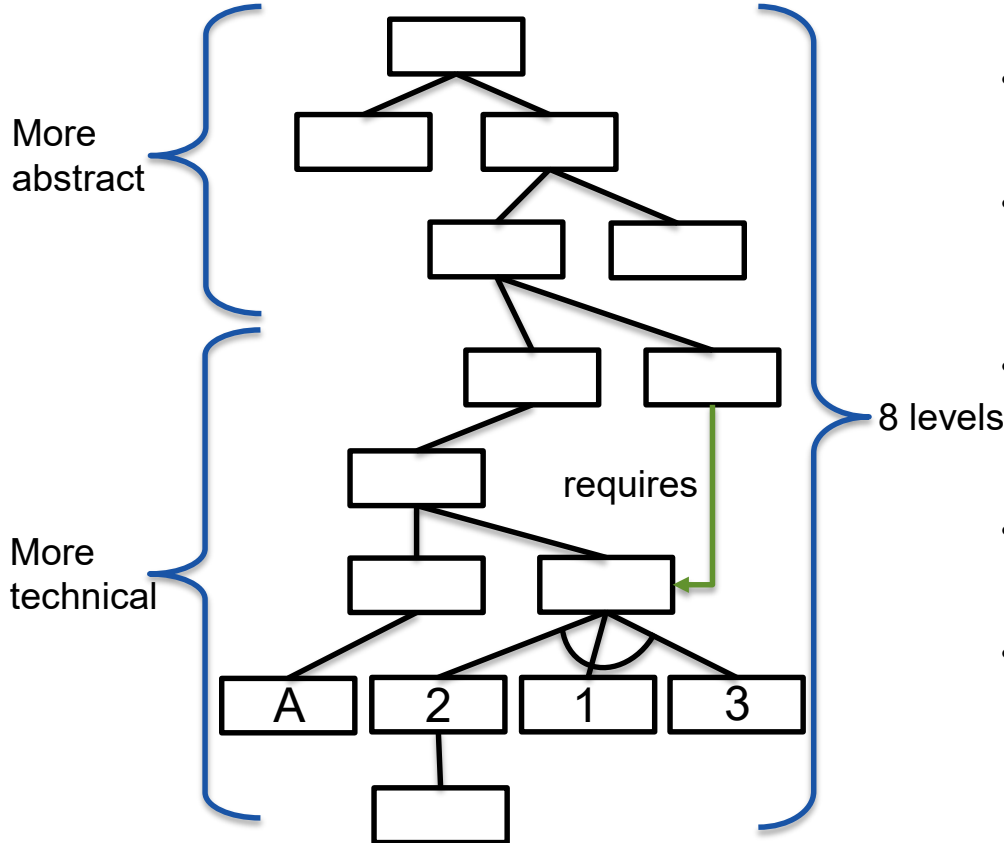

- A feature is typically a functional abstraction (M6) and Boolean features should be preferred (M10).
- Define default feature values (M8).
- Define feature-model views (M9).

Model Organization

- Model hierarchy not deeper than 8 levels (MO1).
- Abstract features should be higher in the hierarchy (MO2).
- Split large models and ensure consistency with *'interface' models* (MO3).
- Avoid complex cross-tree constraints (MO4).
- Maximize cohesion and minimize coupling with feature groups (MO5).

Model Organization

- Model hierarchy not deeper than 8 levels (MO1).
- Abstract features should be higher in the hierarchy (MO2).
- Split large models and ensure consistency with *'interface' models* (MO3).
- Avoid complex cross-tree constraints (MO4).
- Maximize cohesion and minimize coupling with feature groups (MO5).

Dependencies

- D1: *If the models are configured by (company) experts, avoid feature-dependency modeling*

- ~50% of features involved in a dependency
- Add custom dependencies, e.g. recommends

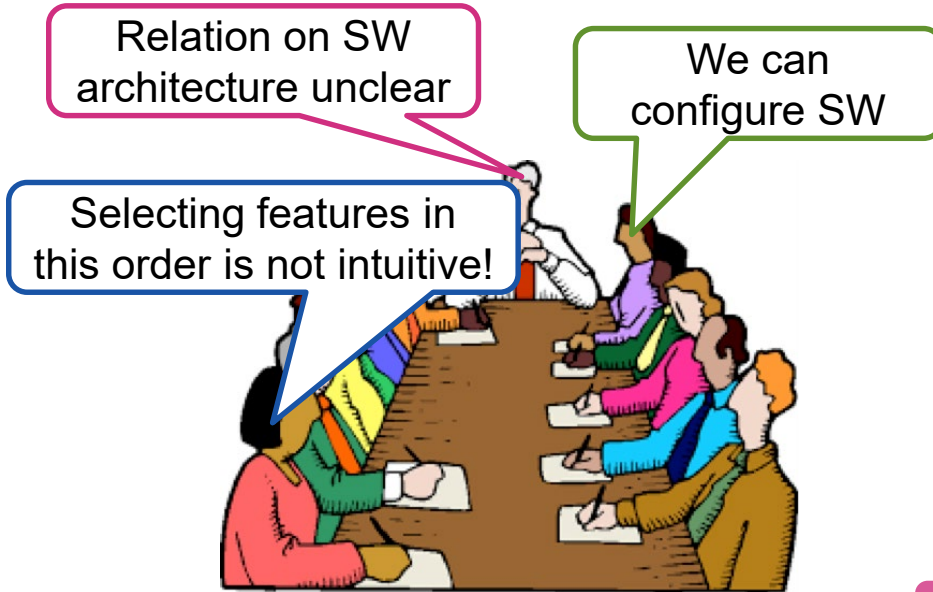

- D2: *If the main users of a feature model are end-users, perform feature-dependency modeling.*

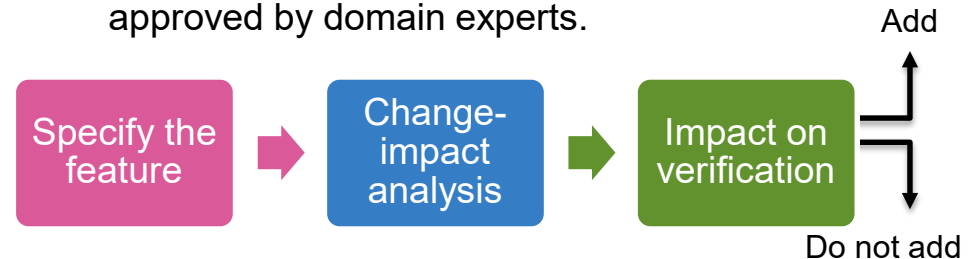

- Support choice-propagation
- Avoid invalid configurations

Quality Assurance, Maintenance and Evolution

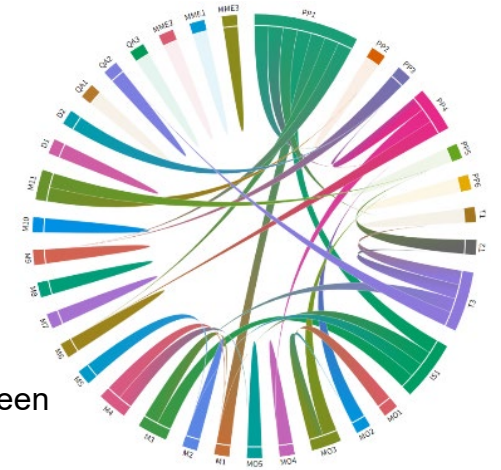

- Validate the feature model in workshops (QA1).
- Use the obtained feature model to derive configurations (QA2).
- Use regression tests to check for invalid configurations (QA3), if D1 applied.
- Use centralized model governance (MME1) and version manage the entire model (MME2).
- MME3: New features should be defined and approved by domain experts.

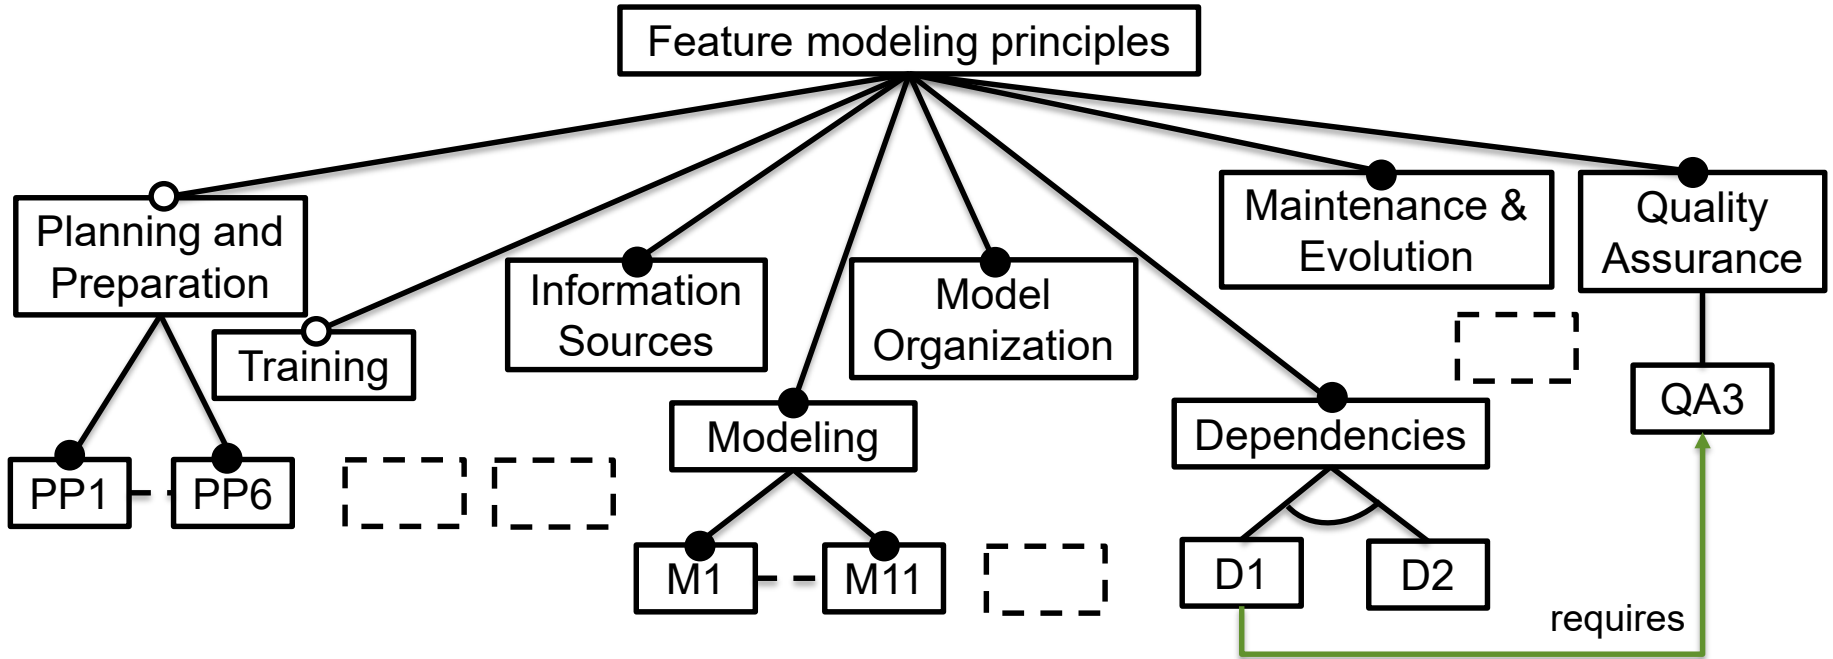

Towards a methodology for feature modeling

- The principles are ordered in the most probable sequence but we do not claim that this represents a feature-modeling process.
- Some principles depend on the modeling context (e.g. D1 vs D2, M9 vs MO3).
- 15 principles impact/are impacted by the application of other principles.

Dependencies between principles

Conclusion

Thank you!
