Learning Objectives

At the end of the class you should be able to:

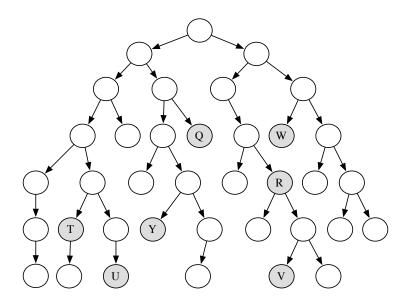

- justify why depth-bounded search is useful
- demonstrate how iterative-deepening works for a particular problem
- demonstrate now depth first branch-and bound works for a particular problem

Bounded Depth-first search

- A bounded depth-first search takes a bound (cost or depth) and does not expand paths that exceed the bound.
 - explores part of the search graph
 - uses space linear in the depth of the search.
- How does this relate to other searches?
- How can this be extended to be complete?

Which shaded goal will a depth-bounded search find first?

- Iterative-deepening search:
 - ▶ Start with a bound b = 0.
 - Do a bounded depth-first search with bound b
 - ▶ If a solution is found return that solution
 - Otherwise increment b and repeat.

- Iterative-deepening search:
 - ▶ Start with a bound b = 0.
 - Do a bounded depth-first search with bound b
 - ▶ If a solution is found return that solution
 - Otherwise increment b and repeat.
- This will find the same first solution as what other method?

- Iterative-deepening search:
 - ▶ Start with a bound b = 0.
 - Do a bounded depth-first search with bound b
 - ▶ If a solution is found return that solution
 - Otherwise increment b and repeat.
- This will find the same first solution as what other method?
- How much space is used?

- Iterative-deepening search:
 - ▶ Start with a bound b = 0.
 - Do a bounded depth-first search with bound b
 - ▶ If a solution is found return that solution
 - Otherwise increment b and repeat.
- This will find the same first solution as what other method?
- How much space is used?
- What happens if there is no path to a goal?

- Iterative-deepening search:
 - ightharpoonup Start with a bound b=0.
 - Do a bounded depth-first search with bound b
 - ▶ If a solution is found return that solution
 - Otherwise increment b and repeat.
- This will find the same first solution as what other method?
- How much space is used?
- What happens if there is no path to a goal?
- Surely recomputing paths is wasteful!!!

Iterative Deepening Complexity

Complexity with solution at depth k & branching factor b:

level	breadth-first	iterative deepening	# nodes
1	1	k	Ь
2	1	k-1	b^2
k-1	1	2	b^{k-1} b^k
k	1	1	b^k
total			

Iterative Deepening Complexity

Complexity with solution at depth k & branching factor b:

level	breadth-first	iterative deepening	# nodes
1	1	k	Ь
2	1	k-1	b^2
k-1	1	2	b^{k-1} b^k
k	1	1	b^k
total	$\geq b^k$	$\leq b^k \left(\frac{b}{b-1}\right)^2$	

- combines depth-first search with heuristic information.
- finds optimal solution.
- most useful when there are multiple solutions, and we want an optimal one.
- uses the space of depth-first search.

- Suppose bound is the cost of the lowest-cost path found to a goal so far.
- What if the search encounters a path p such that $cost(p) + h(p) \ge bound$?

- Suppose bound is the cost of the lowest-cost path found to a goal so far.
- What if the search encounters a path p such that $cost(p) + h(p) \ge bound?$ p can be pruned.
- What can we do if a non-pruned path to a goal is found?

- Suppose bound is the cost of the lowest-cost path found to a goal so far.
- What if the search encounters a path p such that cost(p) + h(p) ≥ bound? p can be pruned.
- What can we do if a non-pruned path to a goal is found?
 bound can be set to the cost of p, and p can be remembered as the best solution so far.
- Why should this use a depth-first search?

- Suppose bound is the cost of the lowest-cost path found to a goal so far.
- What if the search encounters a path p such that cost(p) + h(p) ≥ bound? p can be pruned.
- What can we do if a non-pruned path to a goal is found?
 bound can be set to the cost of p and p can be remembered as the best solution so far.
- Why should this use a depth-first search?
 Uses linear space.
- What can be guaranteed when the search completes?

- Suppose bound is the cost of the lowest-cost path found to a goal so far.
- What if the search encounters a path p such that $cost(p) + h(p) \ge bound?$ p can be pruned.
- What can we do if a non-prined path to a goal is found?
 bound can be set to the cost of p, and p can be remembered as the best solution so far.
- Why should this use a depth-first search?
 Uses linear space.
- What can be guaranteed when the search completes?
 It has found an optimal solution.

- Suppose bound is the cost of the lowest-cost path found to a goal so far.
- What if the earch encounters a path p such that cost(p) + h(p) > bound?
 p can be pruned.
- What can we do if a non pruned path to a goal is found?
 bound can be set to the cost of p, and p can be remembered as the best solution so far.
- Why should this use a depth-fast search?
 Uses linear space.
- What can be guaranteed when the search completes?
 It has found an optimal solution.
- How should the bound be initialized?

Depth-first Branch-and-Bound: Initializing Bound

- The bound can be initialized to ∞ .
- The bound can be set to an estimate of the optimal path cost. After depth first search terminates either:

Depth-first Branch-and-Bound: Initializing Bound

- The bound can be initialized to ∞
- The bound can be set to an estimate of the optimal path cost. After depth-first search terminates either:
 - A solution was found.
 - No solution was found, and no path was pruned
 - No solution was found, and a path was pruned.

Which shaded goals will be best solutions so far?
