

Machine-Oriented Programming

Introduction to C-Programming

Pedro Trancoso

ppedro@chalmers.se

Original slides by Ulf Assarsson

Content

- Introduction: Environment, literature, etc.
- Different languages
- Process: from source to executable
- Types1: char, short, int, unsigned
- Declaration, assignment, type conversion (casting)
- Operators, bitwise, expression evaluation
- Program flow: conditional (if), loops (for, while)
- Functions, function call, parameters, return values

Assembler / ARM-lectures

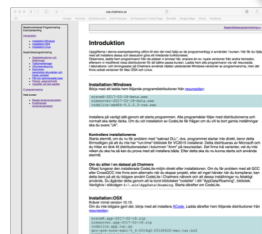

Textbook

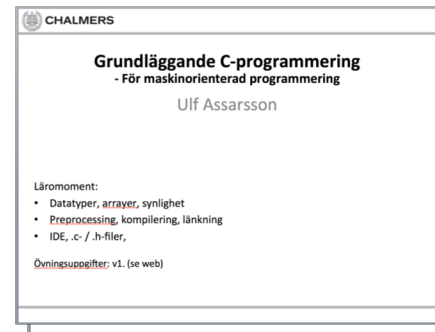

Workbook

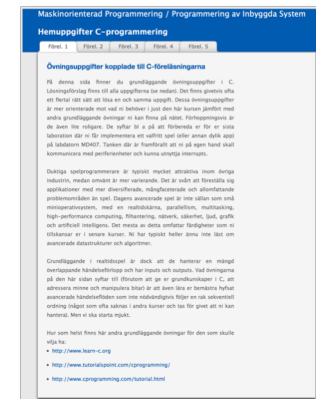

LabPM (online). 5 labs.

Examples (exercises online).

5 C-lectures

Examples C – Exercise tasks. (online)

Same webpage

If you like:

ARM:

The Definitive Guide to ARM® Cortex® -M3 and Cortex-M4 Processors, Third Edition, Joseph Yiu, ARM Ltd, Cambridge, UK.

C:

- The C programming Language (ANSI-C)
 - https://hassanolity.files.wordpress.com/2013/11/the_c_programming_language_2.pdf
- Vägen till C, Skansholm
- C från början, Skansholm

Textbooks?

- The workbook is equivalent to the textbook.
 - Labs – learn how to run things for the target hardware and simulator.
 - Lectures – to understand the workbook (+ lab).
 - Online Example collection:
 - Exercises in assembler/C
- C:
If you need a book for C:
 - The C programming Language (ANSI-C)
 - https://hassanolity.files.wordpress.com/2013/11/the_c_programming_language_2.pdf
 - Vägen till C, Skansholm, 2011.
 - C från början, Skansholm, 2016.
 - C reference card ANSI (on the course's website under "resurssidan")
 - <http://www.cse.chalmers.se/edu/resources/pinsys/ebook/c-refcard.pdf>

C – Exercises

- Online – see the link on the course homepage for today's C lectures.
(The first week's exercise also contains links to alternative beginners C exercises online.)

Integrated Development Environment (IDE)

We use CodeLite which is free and open-source.

Download through the [resurshemsidan](#)!! (NOTE: **not** through <http://codelite.org/>)

CodeLite – Download through Home->Kursmaterial->Programvaror

Resurssida

För kurser i Grundläggande datorteknik, Maskinorienterad programmering och Realtidssystem.

From the terminal

```
> gcc -o hello.exe main.c ← Build
> hello.exe ← Run
Hello World!
>
```

Programming Language Evolution

www.openclipart.org

- 1949: Short Code, 1:st high level language
- 1950s: Autocode, early 50'ies
- 1957: Fortran, IBM
- 1958: Lisp
- 1960: Cobol 60 (Common Business-oriented language)
- 1964: BASIC
- 1960: ALGOL 60 (ALGOritmic Language 1960)
- 1960s: Simula
- 1969: C
- 1972: Prolog
- 1975: Ada
- 1975: Pascal
- 1978: ML

C was originally developed by Dennis Ritchie between 1969 and 1973 at Bell Labs, and used to re-implement the Unix operating system

```
#include <stdio.h>

int main()
{
    printf("Hello World!\n");
    return 0;
}
```

Top 3 programming
languages you used?

[Vote](#)

[View](#)

Different languages

C vs. Java

1. C: Does not have **classes**.
Has **struct** for composite data type.
2. Booleans are NOT a type. There is no **true/false**. **0** is **false** and a value **!= 0** is **true**.
[you usually define TRUE/FALSE as 1 and 0. Even so, 1 && 1 is not necessarily 1! “implementation-specific for the compiler”]
3. No array boundary checks! 😈-vs-😊
4. No exception handling – try/catch
5. No polymorphism or overloading
6. Operations with operands of different types (and type conversion!)
7. Compilation! 😈-vs-😊

```
struct Course {  
    char* name;  
    float credits;  
    int numberOfParticipants;  
};
```

From source code to executable

Pre-Processor

```
// main.c
#include <stdio.h>
#include "foo.h"

#define MAX_SCORE 100
#define SQUARE(x) (x) * (x)

int main()
{
    printf("Highest possible points are %d\n", MAX_SCORE);
    printf("Square of 3 is %d\n", SQUARE(1+2));
    printf("x is %d", foo(0));
    return 0;
}
```

Copy-paste from header files

String find-and-replace

The pre-processor works on the source code at the text-level

Note: If you want to check the output of the pre-processor phase run `gcc -E`!

Compiling

- Processes one .c-file at a time:
 - Creates an object file (.o-file) (e.g. gcc -c), per .c-file, containing:
 - Machine code instructions
 - Symbols for addresses
 - For functions/variables in the object file.
 - For functions/variables in another object file/library.

Note: .o file is in binary format so you need to generate the assembly explicitly to see the instructions and labels generated (e.g. gcc -S)

```
main.s:  
myFkn:    mov    r3, #0  
          ...  
          bx     lr  
  
main: bl   myFkn  
          bx     lr
```

What is the difference between
static and **dynamic** linking?

Linking

- Merge multiple object files into one executable file (.exe/.s19)
- Translate the symbols to (relative) addresses

Types & declarations

```
char c;
```

```
short s;
```

```
int i, j;
```

```
long x;
```

```
x = 2;
```

```
c = 'a';
```

How is 'a' stored in memory?

```
uns
```

```
uns
```

```
uns
```

```
unsigned long x;
```

```
x = 2;
```

```
c = 'a';
```

```
#include <stdio.h>
```

```
int main(void) {
```

```
    printf("size of char  = %d\n", sizeof(char));
```

```
    printf("size of short = %d\n", sizeof(short));
```

```
    printf("size of int   = %d\n", sizeof(int));
```

```
    printf("size of long  = %d\n", sizeof(long));
```

```
}
```

For printf() parameters, see for example [C Reference Guide](#)

ASCII TABLE

Decimal	Hex	Char	Decimal	Hex	Char	Decimal	Hex	Char	Decimal	Hex	Char

size of char = 1
size of short = 2
size of int = 4
size of long = 8

Assignment

```
char c;  
int i, j;
```

```
i = 10;  
j = i;
```

```
c = i;
```

```
i = j + c;
```

What if i = 1024?

Compiler error or warning?

Compiler error or warning?

Value of i? Value of c?

Declarations and Assignments

```
#include <stdio.h>
```

```
int x; ← Declarations
```

```
int main()
{
```

```
    char y;
```

```
    x = 32; ← Assignments
```

```
    y = 'a';
```

```
    x = x + y;
```

```
    printf("x has now value %d and y has value %d, the code for character %c\n",
```

```
    return 0;
```

```
}
```

```
C18GLMM:mop ppedro$ ./x1
x = 293228598 y = 293228608
C18GLMM:mop ppedro$ ./x1
x = 251715638 y = 251715648
C18GLMM:mop ppedro$ ./x1
x = 59990070 y = 59990080
C18GLMM:mop ppedro$ ./x1
x = 157876278 y = 157876288
C18GLMM:mop ppedro$ ./x1
x = 157020214 y = 157020224
C18GLMM:mop ppedro$ ./x1
x = 129105974 y = 129105984
C18GLMM:mop ppedro$ ./x1
x = 405405750 y = 405405760
C18GLMM:mop ppedro$
```

What happens?

```
...
int x;
int y;
y = x + 10;
...
```

A declared variable which has not yet been assigned a value is called **uninitialized**

Type Conversion

```
#include <stdio.h>

int x;

int main()
{
    char y;

    x = 32;
    y = 'a';

    x = x + y;

    printf("x has now value %d and y has value %d, the code for character %c\n", x, (int)y, y);
    return 0;
}
```

Implicit type conversion

Explicit type conversion

Type conversion is also called **cast**, and you can say that you do **casting**.

Arithmetic Operators

Basic assignment		<code>a = b</code>
Addition		<code>a + b</code>
Subtraction		<code>a - b</code>
Unary plus (integer promotion)		<code>++a</code>
Unary minus (additive inverse)		<code>-a</code>
Multiplication		<code>a * b</code>
Division		<code>a / b</code>
Modulo (integer remainder)		<code>a % b</code>
Increment	Prefix	<code>++a</code>
	Postfix	<code>a++</code>
Decrement	Prefix	<code>--a</code>
	Postfix	<code>a--</code>

http://en.wikipedia.org/wiki/Operators_in_C_and_C%2B%2B#Arithmetic_operators

Comparison Operators

Equal to	<code>a == b</code>
Not equal to	<code>a != b</code>
Greater than	<code>a > b</code>
Less than	<code>a < b</code>
Greater than or equal to	<code>a >= b</code>
Less than or equal to	<code>a <= b</code>

http://en.wikipedia.org/wiki/Operators_in_C_and_C%2B%2B#Comparison_operators.2Frelational_operators

Logical Operators

Logical negation (NOT)	<code>!a</code>
Logical AND	<code>a && b</code>
Logical OR	<code>a b</code>

http://en.wikipedia.org/wiki/Operators_in_C_and_C%2B%2B#Logical_operators

Compound Assignment Operators

Operator name	Syntax	Meaning
Addition assignment	<code>a += b</code>	<code>a = a + b</code>
Subtraction assignment	<code>a -= b</code>	<code>a = a - b</code>
Multiplication assignment	<code>a *= b</code>	<code>a = a * b</code>
Division assignment	<code>a /= b</code>	<code>a = a / b</code>
Modulo assignment	<code>a %= b</code>	<code>a = a % b</code>
Bitwise AND assignment	<code>a &= b</code>	<code>a = a & b</code>
Bitwise OR assignment	<code>a = b</code>	<code>a = a b</code>
Bitwise XOR assignment	<code>a ^= b</code>	<code>a = a ^ b</code>
Bitwise left shift assignment	<code>a <<= b</code>	<code>a = a << b</code>
Bitwise right shift assignment	<code>a >>= b</code>	<code>a = a >> b</code>

http://en.wikipedia.org/wiki/Operators_in_C_and_C%2B%2B#Compound_assignment_operators

Bitwise Operators

Bitwise NOT	$\sim a$
Bitwise AND	$a \& b$
Bitwise OR	$a b$
Bitwise XOR	$a \wedge b$
Bitwise left shift	$a \ll b$
Bitwise right shift	$a \gg b$

http://en.wikipedia.org/wiki/Operators_in_C_and_C%2B%2B#Bitwise_operators

How we use Bitwise operations

- Bitwise OR is typically used to set certain bits.
- Bitwise AND is typically used to reset certain bits.
- Bitwise XOR is typically used to invert certain bits.
- Bitwise NOT used to invert all bits.

Quick Review:

- 0x (prefix for hexadecimal), 0b (prefix for binary)
- $a \ll n$ (shift n bits of a to the left and fill with 0 bits coming from the right)
- $a \gg n$ (shift n bits of a to the right and fill with 0 bits coming from the left)

Expression evaluation

```
char c;  
int i, j;  
  
c = 'a';  
j = 1;  
i = c & 0x01 + 512 * j++;
```

Conditionals: If-else statements

```
int x = -4;
```

```
if( x == 0 ) {  
    // ...  
}
```

Evaluates to false so if body does not execute

```
if( x ) {  
    // ...  
}  
else {  
    // ...  
}
```

Evaluates to true so if body is executed ($x \neq 0$)

- **Zero** is considered **false**.
- Anything that is **not zero** is considered **true**.

Loops: while & for

```
int x = 5;

while( x!=0 )
    x--;
```

```
int x = 5;

while( x )
    x--;
```

```
int x;

for( x=5; x; )
    x--;
```

Three equivalent loops.

```
for(int i=0; i<5; i++ ) {
    if(...)
        continue; // jumps till next iteration
    if(...)
        break; // exists the loop.
    ...
}
```

`break` and `continue`

Functions

```
#include <stdio.h>
```

```
int foo(int x, char y)
{
    int sum = 0;

    while(y > 0) {
        sum += x*y;
        y--;
    }

    return sum;
}
```

Arguments (or parameters)

Return value of return type

Arguments are "pass-by value"

```
int var1;
```

```
char var2 = 7;
```

```
var1 = foo(5, var2);
```

var2 still has the value 7
after the function call

Function Prototype

```
#include <stdio.h>
```

```
// function prototype  
int foo(int x);
```

```
int main()  
{  
    printf("x is %d\n", foo(0));  
    return 0;  
}
```

```
int foo(int x)  
{  
    // function body  
}
```

Where is the prototype for
printf?

Bitwise operations: Examples part 1

isSetLSB, isSetMSB, isSetN

```
int
isSetLSB( int x ) {
    if( x & 0x00000001 )
        return( 1 );
    else
        return( 0 );
}
```

```
int
isSetMSB( int x ) {
    return( x & 0x80000000 );
}
```

Is correct?

```
int
isSetMSB( int x ) {
    return( ( x & 0x80000000 ) == 0 ? 0 : 1 );
}
```

```
int
isSetN( int x, int n ) {
    int mask = 0x00000001;
    mask = mask << n;
    return( ( x & mask ) == 0 ? 0 : 1 );
}
```

NOTE:

0x - prefix for hexadecimal

0x0001 << 1 → 0x0002 (0000 0010)

0x0001 << 3 → 0x0008 (0000 1000)

0x0001 << 4 → 0x0010 (0001 0000)

0x0A52 = 0000 1010 0101 0010

0x0A52 << 2 → 0x2948 (0010 1001 0100 1000)

Bitwise operations: Examples part 2

countOnes, set mask bits (or reset mask bits)

```
int
countOnes( int x ) {
    int mask = 0x00000001;
    int count = 0;

    for( int i = 0; i < 32; i++ )
        if( x & (mask << i) ) count++;

    return count;
}
```

```
#define BIT0 0x00000001
#define BIT1 0x00000002
#define BIT2 0x00000004
#define BIT3 0x00000008
#define BIT4 0x00000010

...

int main( void ) {
    int mask = 0, value1, value2;
    ...
    mask = BIT0 | BIT2 | BIT4;
    value1 = value1 | mask; //set
                                //reset
}
```

Bitwise operations: Assignment!

Packing different values into a single variable:

- Pack and Unpack a date (DAY/MONTH/YEAR) into a word (integer) variable

Max day = 31 -> $\log_2(31) = 4.9 \rightarrow 5$ bits

Max month = 12 -> $\log_2(12) = 3.6 \rightarrow 4$ bits

Max year = 9999 -> $\log_2(9999) = 13.3 \rightarrow 14$ bits
