

EDA122/DIT061 Fault-Tolerant Computer Systems
DAT270 Dependable Computer Systems

Welcome to Lecture 7

Generalized Stochastic Petri-Nets (GSPNs)
Software redundancy and Design Diversity
Airbus A330/A340 Fly-by-wire system

Outline

- Generalized Stochastic Petri Nets (GSPNs)
 - Availability GSPN model of hot standby systems
 - Reachability graph
 - Elements of GSPN:s
 - Examples: construction of GSPN models for various systems
- Software redundancy
 - Design diversity
 - N-version programming
 - Recovery blocks
 - Design diversity in Airbus A330/A340 fly-by-wire system

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

2

Generalized Stochastic Petri Nets (GSPN)

- A GSPN provides a graphical syntax for specifying state space models (Markov models)
- It provides a more compact way of describing a state space model than a state diagram
- A Petri net consists of
 - Places (circles)
 - Transitions (vertical bars)
 - Arcs (arrows)
 - Tokens (dots)

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

3

GSPN model of repairable hot standby system with one spare units

Marking shows the case when both modules are working: there are two tokens in the place "up"

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

4

GSPN modell of repairable hot standby system with one spare unit

The # character indicates that the firing rate depends on the number of tokens in the place "up"

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

5

GSPN modell of repairable hot standby system with one spare unit

Marking when one module is up and one is down

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

6

GSPN modell of repairable hot standby system with one spare unit

Marking when both modules are down

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

7

Reachability Graph for the GSPN model

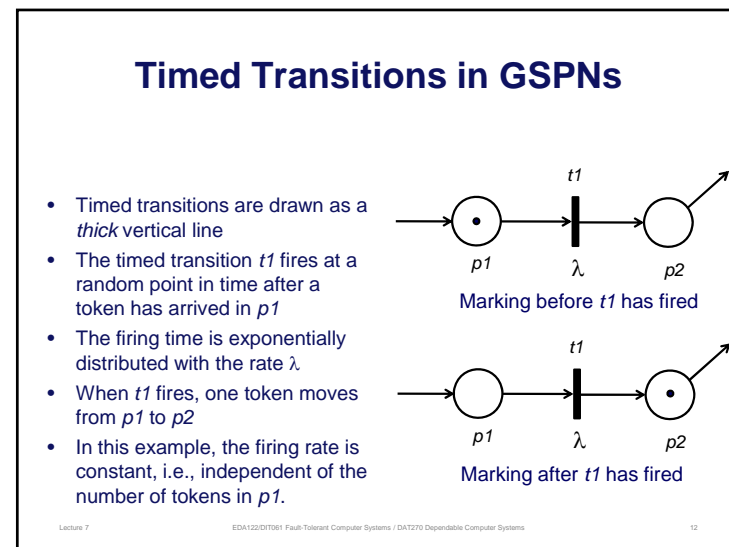

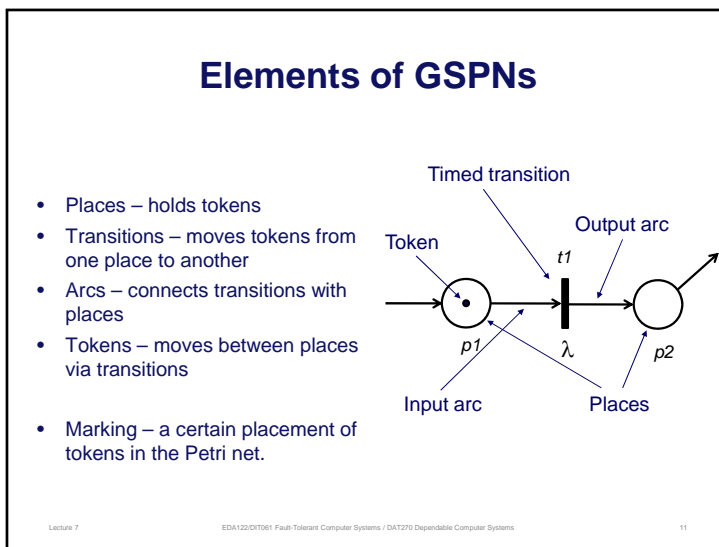

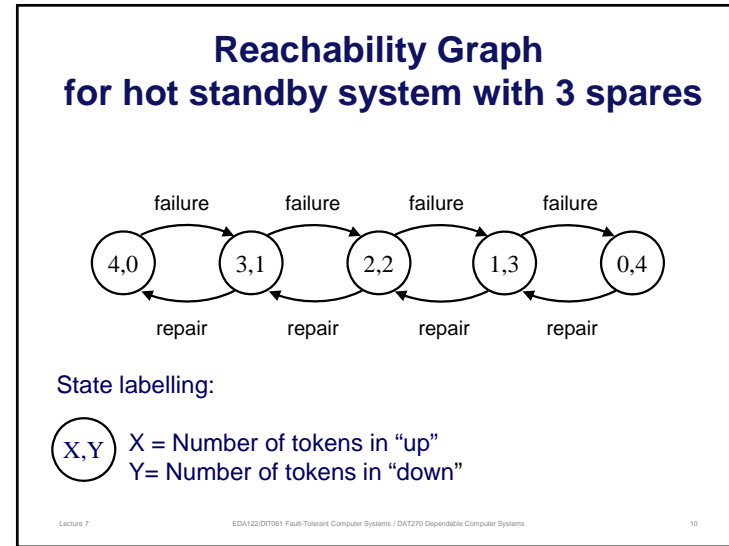

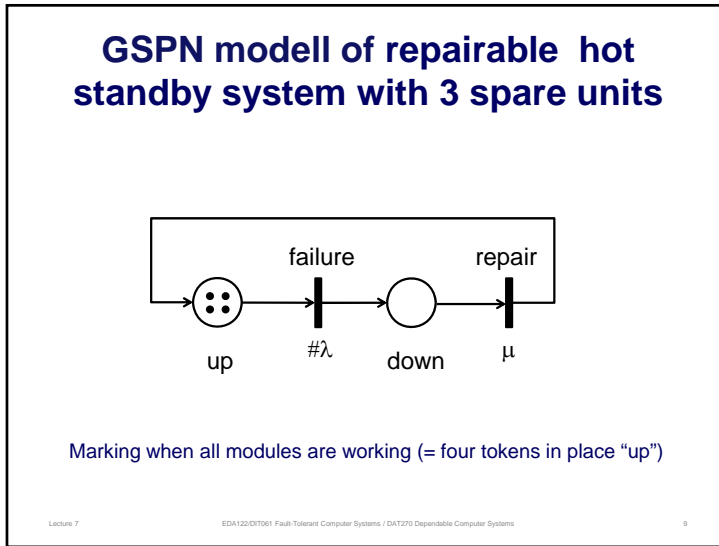

State labelling:

(X,Y) X = Number of tokens in "up"
 Y = Number of tokens in "down"

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

8

Immediate Transition in GSPNs

- An immediate transition is drawn as a *thin* vertical line.
- $t2$ fires immediately when one token has arrived in $p1$

Before immediate transition fires

After immediate transition fires

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

13

Weights for Immediate Transitions

- Immediate transitions leaving the same states can be assigned weights
- In this example, $t2$ has a weight of 6 and $t3$ has a weight of 4, which means that $t2$ fires with 60% probability and $t3$ fires with 40% probability when a token enters $p1$
- Note: Weights are normalized to sum up to one when the GSPN is analysed

Competing immediate transitions with weights

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

14

Arc Multiplicity

- Both timed and immediate transitions can have multiple input and output arcs.
- In this example, $t2$ has two inputs arcs and thus fires when $p1$ contains two tokens.

$t2$ is enabled and fires

$t2$ is not enabled

Marking after $t2$ has fired

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

15

Multiple Output Arcs

- In this example, $t3$ has two outputs arcs and thus produces two tokens when it fires.

$t3$ is enabled and fires

Marking after $t3$ has fired

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

16

Simplified notation for multiple arcs

- The number of input and output arcs can be given by number placed just above an arc.
- In this example, $t4$ has 2 input arcs and 3 output arcs.

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

17

Inhibitor arcs

- An inhibitor arc blocks the firing of a transition based on the marking of a place
- If $p11$ has 2 or more tokens the inhibitor arc blocks the firing of $t6$

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

18

Problems

- Construct a GSPN model for calculating the reliability of a system consisting of two modules operating in active redundancy.
- Construct a GSPN model for calculating the reliability of a TMR system
- Construct a GSPN model for calculating the reliability of a k -of- n system

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

19

GSPN reliability model for system with two modules operating in active redundancy

Figure shows GSPN model with initial marking, i.e., with two working modules

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

20

GSPN reliability model for system with two modules operating in active redundancy

Marking corresponding to one working and one failed module

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

21

GSPN reliability model for system with two modules operating in active redundancy

Marking corresponding to system failure

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

22

GSPN reliability model for TMR system

Marking corresponding to three modules working

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

23

GSPN reliability model for TMR system

Marking corresponding to two modules working, one module failed

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

24

GSPN reliability model for TMR system

Marking corresponding to one module working, two modules failed
 Timed transition is disabled by inhibitor arc

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

25

GSPN reliability model for TMR system

Three modules working

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

26

GSPN reliability model for TMR system

Two modules working, one module failed

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

27

GSPN reliability model for TMR system

One module working, two modules failed => immediate transition enabled

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

28

GSPN reliability model for TMR system

Marking after immediate transition has fired – corresponds to system failure

GSPN reliability model for k-of-n system

Marking corresponding to n modules working

Software redundancy

Software redundancy techniques can be divided in two major classes:

- With diversity
 - Aim is to tolerate software development faults
 - Design diversity
 - Data diversity
- Without diversity
 - Aim is to handle errors of any origin (physical faults, development faults, operator faults)

What is Software Fault Tolerance?

The term "software fault tolerance" can mean two things:

1. "the tolerance of software development faults", or
2. "the tolerance of faults by the use of software"

Definition 1 is more commonly used.
 Definition 2 is used by N. Storey (author of the course book).

The term "software redundancy" corresponds to definition 2.

Design Diversity

Design diversity is used to tolerate development faults in hardware and software

Two techniques for tolerating software design faults:

- N-version programming
- Recovery blocks

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

33

N-version programming

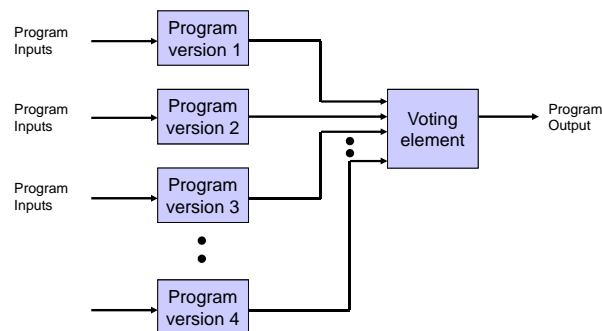

- Uses majority voting on results produced by N program versions
- Program versions are developed by different teams of programmers
- Assumes that programs fail independently
- Resembles hardware voting redundancy

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

34

N-version programming

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

35

Ensuring independence in N-version programming

- Use different design teams for each version
- Use diverse specifications
- Prevent cooperation among design teams
- Use diverse programming languages, compilers, CASE tools, etc.
- ...

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

36

Recovery Blocks

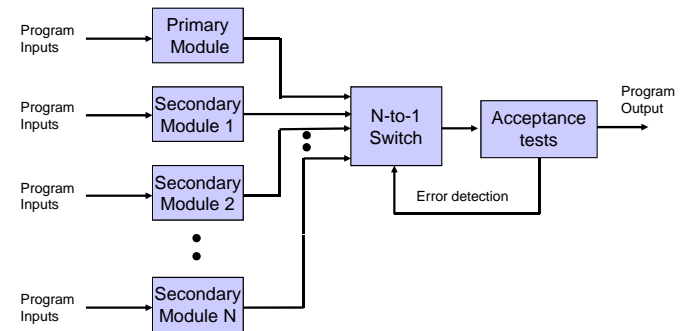

- Uses one primary software module and one or several secondary (back-up) software modules
- Assumes that program failures can be detected by acceptance tests
- Executes only the primary module under error-free conditions
- Resembles dynamic hardware redundancy

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

37

Recovery blocks

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

38

Fault tolerance in the Airbus A330/A340 fly-by-wire system

- Motivation
- System overview
- Design diversity

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

39

Motivation for fly-by-wire system

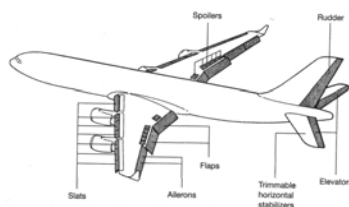

- Improving safety through automated control
 - Reducing the pilot's workload
 - 60% of air traffic accidents are due human errors of some kind (not only pilots errors).
 - Reduced workload for the pilot increases safety
 - Prevent the pilot from inadvertently exceeding the aircraft's controllability

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

40

Flight control surfaces of A340

- Primary flight control surfaces
 - Ailerons - controls the roll axis
 - Elevators – controls the pitch axis
 - Ruder – controls the yaw axis
- Secondary flight control surfaces
 - Flaps – lowering the flaps increases drag (air resistance) and lift
 - Spoilers increases drag and reduces lift
 - Slats – prevents stalls

Figure 15.10 The flight control surfaces of an A340.

Lecture 7 EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems 41

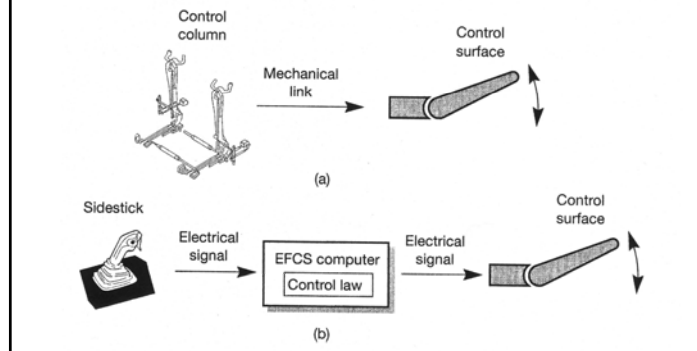

Figure 15.12 A comparison of (a) mechanical and (b) electrical control.

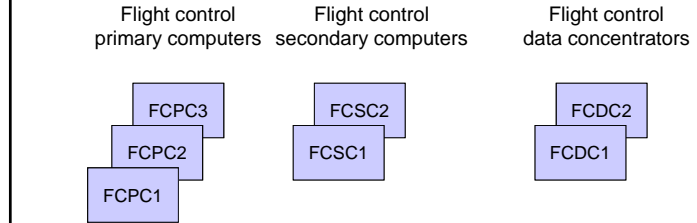

Lecture 7 EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems 42

Design Diversity in Airbus A330/A340

- Two types of computers
 - 3 primary computers
 - 2 secondary computers
- Each computer are internally duplicated and consists of two channels
 - Command channel
 - Monitor channel

Lecture 7 EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems 43

Architecture for A330/A340

Five computers control the flight control surfaces Two computers control the displays and warnings

Lecture 7 EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems 44

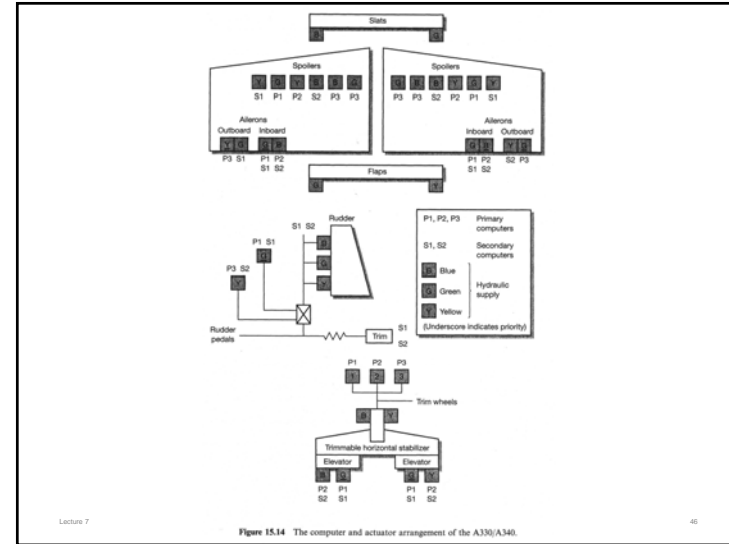

Design Diversity in Airbus A330/A340

- Implementation of primary computers
 - Supplier: Aérospatiale (HW&SW)
 - Hardware: Two Intel 80386 (one for each channel)
 - Software: assembler for command channel, PL/M for monitor channel.
- Implementation of secondary computers
 - Supplier: Sextant Avionique (HW), Aérospatiale(SW)
 - Hardware: Two Intel 80186 (one for each channel)
 - Software: assembler for command channel, Pascal for monitor channel.

47

Normal vs. direct control

Figure 15.16 A comparison of the normal and direct control laws:
 (a) normal control law with aircraft feedback; (b) direct control law.

Lecture 7

48

Summary of fault tolerance features in A330/A340

- Mechanical back-up: Mechanical linkages to the rudder and trimmable horizontal stabilizer give control in the event of total electronic system failure
- Computers: Five computers of two types with diverse hardware and software
- Sensors: Dual or triple redundant sensors
- Actuators: Single, double or triple actuators
- Hydraulic supplies: Three independent circuits and five pumps; hydraulic power can be produced by engines and ram air turbine
- Electrical supplies: The A330 uses six generators and two batteries; four generators are driven by the engines, one by an auxiliary power unit (APU) and one by the hydraulic system.

50

Overview of Lecture 8

- Fault tolerance in space computers
Guest lecture by Torbjörn Hult, RUAG Aerospace Sweden (formerly Saab Space)

Preparations:

- Ariane 501 failure report
- The US space shuttle's computer system, page 152 -154 in the course book
- Lecture slides

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

51

Overview of Lecture 9

- Management
- Life-cycles models
- Standards
- Safety case
- Verification and Validation
- Fault-tree analysis
- Failure mode effects analysis

Preparations:

- Lecture notes
- Chapter 3 - 5 in the course book, see reading instructions on home page.

Lecture 7

EDA122/DIT061 Fault-Tolerant Computer Systems / DAT270 Dependable Computer Systems

52
