# Finite Automata Theory and Formal Languages TMV027/DIT321 - LP4 2018 

## $\epsilon$-NFA and RE

## Assignment 3 - Deadline: Sunday 22nd of April 23:59

## Assignments should be done and submitted individually!

For obtaining full points the answers should contain enough explanation/description so that they are easy to understand.

1. (2.75pts) Convert the following $\epsilon$-NFA into a DFA by using the method explained in class (please keep the names of the states to facilitate correction):

|  | $\epsilon$ | 0 | 1 |
| ---: | :---: | :---: | :---: |
| $\rightarrow q_{0}$ | $\emptyset$ | $\left\{q_{1}\right\}$ | $\left\{q_{0}, q_{2}\right\}$ |
| $q_{1}$ | $\left\{q_{2}\right\}$ | $\left\{q_{4}\right\}$ | $\left\{q_{3}\right\}$ |
| $q_{2}$ | $\emptyset$ | $\left\{q_{1}, q_{4}\right\}$ | $\left\{q_{3}\right\}$ |
| $q_{3}$ | $\left\{q_{5}\right\}$ | $\left\{q_{4}, q_{5}\right\}$ | $\emptyset$ |
| $q_{4}$ | $\left\{q_{3}\right\}$ | $\emptyset$ | $\left\{q_{5}\right\}$ |
| ${ }^{*} q_{5}$ | $\emptyset$ | $\left\{q_{5}\right\}$ | $\left\{q_{5}\right\}$ |

2. (1.5pts) Let $\Sigma$ be $\{0,1\}$. Use your intuition and give a NFA without $\epsilon$-transitions which recognises the language generated by the regular expression $\left(0+01^{*}\right)^{*}(\epsilon+1) 1(\epsilon+0+1)^{*}$.
3. (1.25pts) Define a regular expresion generating the language over the alphabet $\{0,1\}$ where words start and end with a 1 , have a length of at least two and where every 0 in the word is immediately followed by at least a 1 .
Example of accepted words: 1010111, 1101, 1011010111, 11
Example of non accepted words: 10011, 100011
4. Consider the following DFA, where "-" indicates no possible movement for the input:

$$
\begin{array}{r||c|c|c} 
& 0 & 1 & 2 \\
\hline \rightarrow q_{0} & q_{0} & q_{1} & q_{2} \\
q_{1} & - & q_{3} & q_{2} \\
q_{2} & - & q_{1} & q_{4} \\
q_{3} & q_{4} & - & q_{3} \\
{ }^{*} q_{4} & - & q_{4} & -
\end{array}
$$

Construct the regular expression that corresponds to the DFA above by
(a) (2.25pts) Eliminating states: eliminate first $q_{3}$, then $q_{2}$, and finally $q_{1}$;
(b) (2.25pts) Solving equations: solve and eliminate $E_{4}$, then solve and eliminate $E_{3}$, eliminate $E_{2}$, solve and eliminate $E_{1}$, finally solve $E_{0}$.

Show enough information in the process so we can follow what you do.
