# Haskal - a Haskell shell

#### Mats Jansborg and Aleksandar Despotoski

May 18, 2006

(ロ)、(型)、(E)、(E)、 E、 の(の)

Why a new type of Shell?

Limited functionality

No type safety

# Unix shells as Monads

Where | corresponds to >>=

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへぐ

cat x to return x

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

http://haskell.org/hashell

Make System functions available as Haskell functions
 Example

cat :: Program String String

Define operators to compose programs and Haskell functions

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

#### Example

> < corresponds to the normal pipe in Shells

# General Approach

- Importing the programs
  - Go through the path
  - Compile the file with all programs (to Object file)
- Read User Input
- Compile and link together with programs and operators

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

# **HS-Plugins**

- Used for executing Haskell code dynamically
- Compiling, linking and running is done by hs-plugins
- Works fine for compiling program files, but rather slow for user input.

### How to model commands?

Using the monad analogy:

instance Monad command where ...

echo :: [Arg] -> String -> Command String
cat :: [Arg] -> a -> Command a
echo [] "foo" >>= cat [] :: Command String

Problem: we need to (de)serialise inputs and outputs

◆□▶ ◆□▶ ◆□▶ ◆□▶ □□ - のへぐ

## Add support for serialisation

class Marshal a where marshal :: a -> ([Word8] -> [Word8]) unmarshal :: [Word8] -> a marshalList :: [a] -> ([Word8] -> [Word8]) unmarshalList :: [Word8] -> [a]

◆□ > ◆□ > ◆臣 > ◆臣 > ○臣 ○ のへ⊙

### Commands in Haskal

```
newtype Command i o = Command [IO ()]
```

- instance Cmd Command where ...
  instance Cmd (->) where ...
  instance Cmd Program where ..
- newtype DoIO i o = DoIO (i -> IO o) instance Cmd DoIO where ...

### Redirection

Combining commands in parallel
 (>|<) :: (Cmd c1, Cmd c2, Marshal t,
 Marshal i, Marshal o) =>
 c1 i t -> c2 t o -> Command i o
 Redirecting standard output, input and error
 (>|), (|<), (&>|) :: (Marshal i, Marshal o, Cmd c) =>
 c i o -> String -> Command i o

#### Example

```
$ls >|< words >|< map length >|< sum
1228</pre>
```

```
$ls >|< map (dropWhile (/='.')) . words >| "file"
$cat |< "file"
.cabal
.hs</pre>
```

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへぐ

. . .

#### Name clashes

\$1s >|< words >|< map length >|< sum</p>

```
<haskal>:1:32:

Ambiguous occurrence 'sum'

It could refer to either 'Data.List.sum',

imported from Prelude at

Implicit import declaration

or 'P.sum', imported from P at

/tmp/MeZeX10978.hs:2:0-8
```

```
Need to use qualified names
$1s >|< words >|< map length >|< Prelude.sum
1228
```

# Command line arguments

Argument is a typeclass too
 class Argument a where
 toArgument :: a -> [String]
 listToArgument :: [a] -> [String]
 instance Argument String ...
 instance Argument (Program i o) ...
 instance Argument Int ...
 ...
 instance Argument a => Argument [a] ...

Add options to programs with

(-.) :: Argument a => Program i o -> a -> Program i o
(#) :: Argument a => Program i o -> a -> Program i o

### What we'd really want

More precise types:

ls :: Program i [File]

Problem: argument changes the type ls -."l" :: Program i [FileDetails]

- We need dependent types for this
- Nicer syntax, writing e.g.

ssh -."1" #"jansborg" #"remote.mdstud.chalmers.se"
is really annoying for interactive use.

# Other features implemented

Job control.

- ► Tab completion of program names and files.
- Commands to haskal are prefixed with ':'
  - :cd changes directory
  - :background, :foreground and :jobs deals with job control.
  - :load imports extra modules into the command line session
  - :rehash regenerate the module with the program bindings

- :typeOf gives the type of an expression. Works only for monomorphic types.
- :which gives the path to a program.

### Non-features

- Any kind of error handling mechanism.
- Exit codes or similar.
- ► A way of defining functions interactively or by sourcing a file.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへぐ

# Conclusions

Although most users think of the shell as an interactive command interpreter, it is really a programming language in which each statement runs a command. Because it must satisfy both the interactive and programming aspects of command execution, it is a strange language, shaped as much by history as by design.

- Brian Kernighan Rob Pike 1984
- A Haskell shell is probably only usable for scripting.
- Rewrite using GHC API.
